PREFACE.

The following tables were prepared under the direction of Prof. JOSEPH WINLOCK, now Director of Harvard College Observatory, while Superintendent of the *American Ephemeris and Nautical Almanac.* They have been used in the preparation of the portions of that work which relate to the fixed stars, commencing with the volume for 1865; except that some modifications of the mean places and annual motions of the standard stars have been introduced in the present volume and in the Ephemeris for 1870. These changes are given in Table XXIX.

A few tables, not directly required in the construction of the Ephemeris, have been added to make the series more complete.

The essential features of these tables are those of BESSEL'S *Tabulæ Regimontanae* and WOLFERS' *Tabulæ Reductionum;* but they differ from them in form and arrangement, in using the constants of STRUVE and PETERS, and in providing for small terms in the reduction of star-places, which are usually neglected. It has not been thought necessary, however, to include in Table XXIV, which contains the reductions of places of the standard stars, any of the stars of WOLFERS' list, except α and δ Ursæ Minoris; as the corrections for differences of mean place and annual motion for the other stars are easily supplied.

The computations have been made by assistants in the Nautical Almanac office, of whom Mr. W. P. G. BARTLETT and Mr. G. W. HILL deserve special mention. To the latter I am indebted for a careful revision of the tables and proofs, and the materials for the introductory explanations. He has also prepared the articles on the *Derivation and Reduction of Star Places*, and the places of β^1 Scorpii, β and η Draconis, and 61^1 Cygni, which are given in the Introduction.

These tables are published with the hope that they will afford aid to astronomers in future work, while they exhibit the construction and character of that portion of the *American Ephemeris* to which they relate.

J. H. C. COFFIN,

Prof. Math. U. S. Navy, Superintendent of Nautical Almanac.

WASHINGTON, *February*, 1869.

GENERAL TABLES.

TABLE I. Longitudes of the principal Observatories from Washington 3

II. Number of days from Jan. 0 in common years, Jan. 1 in bissextile years, for each calendar date 4

III. Reduction of hours and minutes to decimals of a day and year 5

IV. Fraction of the year from noon of Jan. 0 in common years, Jan. 1 in bissextile years, to midnight of each day of the year 6

V. Annual precession.—Motion of the Ecliptic 8

VI. Arg. I, for aberration and solar nutation.
Arg. II, for secular inequality of Arg. I.
Arg. III, for lunar nutation.
Mean obliquity of the ecliptic.
Time from beginning of Bessel's fictitious year 9

VII. Secular inequality of Arg. I.
Precession for each 10 days.
Aberration of the sun's longitude.
Solar nutation of longitude, right ascension and the obliquity of the ecliptic . . 12

VIII. Lunar nutation of longitude, right ascension and the obliquity of the ecliptic . . 13

IX. Coefficients and auxiliaries for computing A, B, and E 13

X. Terms in A and B, which depend on $\odot$, or $A_\odot$ and $B_\odot$, for 1850 14

XI. Secular variations of $A_\odot$ and $B_\odot$ 15

XII. Terms in A and B, which depend on Ω, or A_Ω and B_Ω, for 1850 16

XIII. Secular variations of A_Ω and B_Ω 33

XIV. Terms in E, which depends on $\odot$, or $E_\odot$ for 1850, and its secular variation . . 33

XV. Terms in E, which depend on Ω, or E_Ω for 1850, and its secular variation . . . 33

XVI. Arg. IV, for terms depending on 2 $\mathbb{C}$.
Arg. V, for terms depending on $\mathbb{C} - \Gamma'$, with multiples of their periods 34

XVII. Terms in A and B, which depend on 2 $\mathbb{C}$ and $\mathbb{C} - \Gamma'$, or $A_{\mathbb{C}}$, $B_{\mathbb{C}}$, and $A'_{\mathbb{C}}$ . . 35

XVIII. Logarithms of C and D 36

XIX. H and the logarithms of h and i 50

XX. For finding the annual precession of a star in right ascension and declination . . 54

SPECIAL TABLES, FOR STANDARD STARS OF THE AMERICAN EPHEMERIS.

Page.

TABLE XXI. Mean right ascensions and declinations, annual and secular variations, and proper motions of 198 stars, for 1860.0 68

XXII. Mean right ascensions and declinations of the same stars for the beginning of each year from 1865 to 1872 76

XXIII. Mean right ascensions and declinations of the same stars for the beginning of each year from 1873 to 1880 84

XXIV. $\Delta_{\odot}{}^{a}$, $\Delta_{\odot}{}^{\delta}$, $\Delta_{\Omega}{}^{a}$, and $\Delta_{\Omega}{}^{\delta}$, or terms in the reductions of right ascensions and declinations, which depend on $\odot$ and Ω, for 156 of the standard stars, from 1865 to 1880 92

XXV. Terms for 51 Cephei, σ Octantis, and λ Ursæ Minoris, to be multiplied by $\frac{1}{100}(t-1870)^2$ 248

XXVI. Motion of $\odot + \Omega$ and $\odot - \Omega$ for sidereal days 248

XXVII. Values of $\odot + \Omega$ and $\odot - \Omega$ for the beginning of each year, and terms depending on $\odot + \Omega$ and $\odot - \Omega$ for α and λ Ursæ Minoris, 51 Cephei, and σ Octantis. 249

XXVIII. Terms depending on 2 $\mathfrak{C}$ for α, δ and λ Ursæ Minoris, and 51 Cephei . . . 251

"Argument 2 $\mathfrak{C}$" for beginning of each year 253

XXIX. Reduction of places of stars in the *American Ephemeris*, 1865—1869, to those adopted in these tables 254

XXX. AUWERS' correction of the place of *Sirius* for orbital motion 256

SUPPLEMENTARY TABLES OF SMALL TERMS IN NUTATION.

TABLE XXXI. Terms in the reduction of right ascensions, which depend on 2 $\mathfrak{C}$ 258

XXXII. Terms in the reduction of right ascensions, which depend on $\mathfrak{C} - \Gamma'$ 258

XXXIII. Terms in the reduction of declinations, which depend on 2 $\mathfrak{C}$ 259

XXXIV. Terms in the reduction of declinations, which depend on $\mathfrak{C} - \Gamma'$ 259

XXXV. Arguments VI — X, for small terms in *A* and *B* 260

Inequalities of Arg's VI, VII, VIII 261

XXXVI. Small terms in *A* and *B* 262

LIBRARY OF THE UNIVERSITY OF CALIFORNIA.

DESCRIPTION AND USE OF THE TABLES.

These tables comprise—

1. *General tables*, which serve to form the arguments depending on time and place, or give those quantities, which are functions of the time and are independent of the place of any particular star. They extend from 1750 to 1900. A table for computing precessions in right ascension and declination, and *Supplementary Tables* of small terms in nutation have been added.

2. *Special Tables* for the standard stars of the *American Ephemeris and Nautical Almanac* for the years 1865 to 1880, giving their mean places and annual motions, and the means of reducing to their apparent places on any day within that period.

GENERAL TABLES.

TABLE I contains the longitudes of the principal Observatories from Washington, as given by Dr. GOULD in the *American Ephemeris* for 1870. West longitudes* are considered as positive.

d	is the longitude in hours, minutes, and seconds.
d'	in decimals of a day.
d''	in decimals of a year.

TABLE II gives for each calendar date the number of days from Jan. 0 in common years, or from Jan. 1 in bissextile years.

TABLE III contains the equivalents of hours and minutes in decimals of a day and a year.

TABLE IV gives for each midnight the part of a tropical year elapsed from noon of Jan. 0 in common years, Jan. 1 in bissextile years. For noon subtract $0^y.00137$.

Adding k'' from Table VI, d'' from Table I, and the part of a year from Table III, corresponding to the hours and minutes after mean midnight, we have for any given time the fraction of the year, τ, elapsed from the beginning of the fictitious year. In this table 1 day $= 0^y.00273791$.

TABLE V, contains for each fifth year, STRUVE and PETERS'† values of the annual precession of the equinoxes, &c., viz:

Luni-solar precession, $\psi = 50''.3798 - 0''.0002168\ (t - 1800)$

General precession, $\psi' = 50''.2411 + 0''.0002268\ (t - 1800)$

$m = 46''.0623 + 0''.0002849\ (t - 1800) = 3^s.07082 + 0^s.0000190\ (t - 1800)$

$n = 20''.0607 - 0''.0000863\ (t - 1800)$, and its logarithm

$\pi = 0''.4776 \quad - 0''.000007 \quad (t - 1800)$

$M = 172°\ 45'\ 31'' + 33''.23\ (t - 1800)$

in which t is the number of years.

The annual precession of a fixed star is—

In *Right ascension*,	$\Delta\alpha = m + n \sin \alpha \tan \delta$
Declination,	$\Delta\delta = n \cos \alpha$
Longitude,	$\Delta\lambda =$ Gen. Prec. $+ \pi \cos (\lambda - M) \tan \beta$
Latitude,	$\Delta\beta = - \pi \sin (\lambda - M)$

TABLE VI contains for Washington mean noon of Jan. 0 in common years, Jan. 1 in bissextile years, of each year from 1750 to 1900, the following quantities:

1. Arg. I, which is Arg. I of HANSEN and OLUFSEN'S *Tables du Soleil*, augmented by $0^d.01553$ for the constants added in the tables of inequalities, reduced to the meridian of Washington, and corrected for the inequalities of long period in Tables VI, VII, and VIII of that work.

* Longitudes should be reckoned west, or east, to the meridian where the local reckoning of the day changes. This may be assumed as $+ 7^h$ or $- 17^h$ from Washington.

† Dr. C. A. F. PETERS, *Numerus Constans Nutationis*, pp. 66, 71, &c.

2. Arg. II, which is Arg. V of HANSEN and OLUFSEN'S tables, and is used in finding the secular inequality of Arg. I from Table VII.

Arg. I + *its inequalities* + d' + *day of year*, (the day of the year including the fractional part corresponding to the local mean time,) is the argument of solar nutation and aberration in Tables VII, X, XI, XVIII, and XIX. In general it will be sufficient to add to Arg. I the secular inequality in Table VII multiplied by $(t - 1850)$. But if we wish to take into account the periodic pertubations of the sun, as is done in the preparation of the *American Ephemeris*, it will be necessary to use Arg. I + *its inequalities* of HANSEN and OLUFSEN'S tables. The difference, however, cannot exceed $0^d.011$, and will seldom attain this limit.

3. Arg. III, which is the number of days after, (or when negative, before) the time when the longitude of the moon's ascending node was 0. It is derived from PEIRCE'S *Tables of the Moon*. Its period, in 1850, is $6798^d.39$ nearly.

Arg. III + d' + *day of year*, or, if it exceed the limit of the table,
Arg. III + d' + *day of year*—$6798^d.39$,

is the argument of those terms of nutation which depend on the longitude of the moon's node, in Tables VIII, XII, and XIII.

4. The mean obliquity of the ecliptic, as obtained from PETERS.*

$$\omega = 23^\circ\ 27'\ 54''.22 - 0''.4645\ (t - 1800) - 0''.0000014\ (t - 1800)^2$$

5. The mean time elapsed since the sun's mean longitude was 280°, the beginning of Bessel's *fictitious year*.

k is its value in hours, minutes, and seconds.
k' in decimals of a day,
k'' in decimals of a year.

It is also the longitude of Washington from the *fictitious meridian* of Table XXIV, or the meridian on which the mean sun was at the beginning of the fictitious year.

$k + d$ will be the longitude of any place reckoned west from the fictitious meridian. The sidereal time at this meridian when the fictitious year begins is always $18^h\ 40^m = 280°$; and at any other meridian $18^h\ 40^m - (k + d.)$

TABLE VII contains for each 10 days—

1. The secular inequality of Arg. I due to the change of eccentricity and perigee of the sun's orbit, derived from Table IX of HANSEN and OLUFSEN'S tables. This inequality is to be multiplied by $(t - 1850)$, t being the entire number of years, and the product added to Arg. I. The argument of this column is

Arg. II + d' + *day of year*.

2. The precession of the equinoxes in longitude, which is used in reducing longitudes from the mean equinox of one date to the mean equinox of another date. It is given for 1850. Its variation in 100 years is

$\triangle p = +\ .000452\ p$, p being the value in the table.

3. The aberration of the sun's longitude, to be applied to the sun's true longitude to obtain its apparent longitude. Its value, with STRUVE'S† constant is

$$\triangle \odot = -\ 20''.4451 - 0''.3429 \cos (280^\circ.4 - \odot).$$

The argument of this and the following column is

Arg. I + *its inequalities* + d' + *day of year*.

4. The solar nutation for the epoch 1850.‡

In *Longitude*, $\triangle \lambda = -\ 1''.2694 \sin 2\odot + 0''.1477 \sin (\odot + 82^\circ\ 34')$
Right ascension, $\triangle \alpha = -\ 0^s.0776 \sin 2\odot + 0^s.0090 \sin (\odot + 82^\circ\ 34')$

and of the *obliquity*, increased by the mean motion in the fraction of the year,

$$\triangle \omega = -\ 0''.4645\ \tau + 0''.5508 \cos 2\odot + 0''.0092 \cos (\odot + 280^\circ\ 21')$$

TABLE VIII contains, also for the epoch 1850, the lunar nutation,‡

* PETERS' *Numerus Constans Nutationis*, pp. 66, 71.
† STRUVE'S *Constant de l'Aberration*, p. 47.
‡ PETERS' *Numerus Constans Nutationis*, pp. 46–48.

In *Longitude*, $\Delta\lambda = -17''.2491 \sin \Omega + 0''.2073 \sin 2\Omega$
In *Right Ascension*, $\Delta\alpha = -1^s.0549 \sin \Omega + 0^s.0127 \sin 2\Omega$
Of the *Obliquity*, $\Delta\omega = +9''.2235 \cos \Omega - 0''.0896 \cos 2\Omega$

The equation of the equinoxes, or the reduction from the mean to the true equinox of date, is the sum of the solar and lunar nutations in longitude and right ascension, respectively, in Tables VII and VIII.

The true obliquity at date is the sum of the mean obliquity for the beginning of the year, and the two variations of the obliquity in the same tables.

The variations in 100 years of these values are—

In *Longitude*, $-0''.0172 \sin \Omega$
In *Right ascension*, $-0^s.00115 \sin \Omega$
In *the Obliquity*, $+0''.0009 \cos \Omega$

The terms omitted, which exceed 0″.007, are—

In *Longitude*,	In *Right Ascension*,	In *the Obliquity*,
$+0''.0125 \sin (2\odot - \Omega)$	$+0^s.00077 \sin (2\odot - \Omega)$	$-0''.0067 \cos (2\odot - \Omega)$
$-0.2041 \sin 2\,\mathbb{C}$	$-0.01248 \sin 2\,\mathbb{C}$	$+0.0886 \cos 2\,\mathbb{C}$
$-0.0339 \sin (2\,\mathbb{C} - \Omega)$	$-0.00208 \sin (2\,\mathbb{C} - \Omega)$	$+0.0181 \cos (2\,\mathbb{C} - \Omega)$
$-0.0261 \sin (3\,\mathbb{C} - I')$	$-0.00160 \sin (3\,\mathbb{C} - I')$	$+0.0113 \cos (3\,\mathbb{C} - I')$
$+0.0677 \sin (\mathbb{C} - I')$	$+0.00414 \sin (\mathbb{C} - I')$	
$+0.0115 \sin (\mathbb{C} + I')$	$+0.00070 \sin (\mathbb{C} + I')$	
$+0.0150 \sin (\mathbb{C} + I' - 2\odot)$	$+0.00092 \sin (\mathbb{C} + I' - 2\odot)$	

In these and preceding formulæ,
$\odot$ = the sun's true longitude.
Ω = the mean longitude of the moon's ascending node.
$\mathbb{C}$ = the moon's mean longitude.
I' = the longitude of the sun's perigee.
I' = the longitude of the moon's perigee.

TABLE IX contains the values for different years of the coefficients and auxiliary angles, which enter into the expressions for A, B, and E, as denoted by BESSEL, and hereafter given. They are derived from PETERS' *Numerus Constans Nutationis*.

TABLE X contains, for 1850, those terms in A and B which depend on the sun's longitude, viz:

$$A_\odot = -.02519 \sin 2\odot + .00294 \sin (\odot + 82°\ 34')$$

$$B_\odot = -0''.5508 \cos 2\odot - 0''.0093 \cos (\odot + 280°\ 21')$$

The argument is

Arg. I + *its inequalities* + d' + *day of year*.

TABLE XI contains, for the same argument, the variations of $A_\odot$ and $B_\odot$ in 100 years, or

$$\delta A_\odot = -.000063 \cos (\odot + 83°.2) - .000020 \sin (\odot + 83°.2)$$

$$\delta B_\odot = +0''.0003 \cos 2\odot + 0''.00028 \sin (\odot + 280°.4) + 0''.00001 \cos (\odot + 280°.4)$$

These are to be multiplied by $\frac{1}{100}(t - 1850)$, and the products added to $A_\odot$ and $B_\odot$ taken from the preceding table.

TABLE XII contains the terms in A and B, which depend on the longitude of the moon's node, viz:

$$A_\Omega = -.34236 \sin \Omega + .00410 \sin 2\Omega$$

$$B_\Omega = -9''.22355 \cos \Omega + 0''.08955 \cos 2\Omega$$

The coefficients are for 1850. The argument is

Arg. III + d' + *day of year*, or if it exceed 3400^d,
Arg. III + d' + *day of year* − $6798^d.39$,
(the day of the year including the fractional part corresponding to the local mean time.)

When the argument is negative the sign of A_{Ω}, as given in the table, must be changed: the sign of B_{Ω} remains the same.

TABLE XIII contains, for the same argument, the variations of A_{Ω} and B_{Ω}, or

$$\delta A_{\Omega} = -.00031 \sin \Omega$$

$$\delta B_{\Omega} = -0''.0009 \cos \Omega - 0''.0001 \cos 2\,\Omega, \text{ (in units of the 4th decimal place.)}$$

These are to be multiplied by $\frac{1}{100}(t - 1850)$ and the products added to A_{Ω} and B_{Ω} of Table XII. When the argument is negative δA_{Ω} changes sign.

By means of Tables IV, VI, VII, X, XI, XII, and XIII, we obtain

$$A = \tau + A_{\odot} + \textit{its sec. var.} + A_{\Omega} + \textit{its sec. var.}$$

$$B = \quad B_{\odot} + \textit{its sec. var.} + B_{\Omega} + \textit{its sec. var.}$$

the logarithms of which are given in the American Ephemeris for Washington mean midnight. With the longitude and Table III we may also find their values for any other place and time.

The terms of short period, which depend on $2\,\mathbb{C}$ and $\mathbb{C} - I'$ may be supplied from Table XVII, and several other small terms from Table XXXVI.

TABLE XIV gives for 1850,

$E_{\odot} = -0''.0035 \sin 2\,\odot$, and its variation in 100 years,

$\delta E_{\odot} = +0''.0005 \sin 2\,\odot$, in units of the 4th decimal place.

The argument is

Arg. I + *its inequalities* + d' + *day of year*.

TABLE XV gives for 1850,

$E_{\Omega} = -0''.0483 \sin \Omega + 0''.0015 \sin 2\,\Omega$, and its variation in 100 years,

$\delta E_{\Omega} = +0''.0069 \sin \Omega - 0''.0001 \sin 2\,\Omega$, (in units of the 4th decimal place.)

The argument is Arg. III + d' + *day of year*, or Arg. III + d' + *day of year* — $6798^{d}.39$. When it is negative the signs of E_{Ω} and δE_{Ω}, as given in this table, must be changed.

$\delta E_{\odot}$ and δE_{Ω} are to be multipled by $\frac{1}{100}(t - 1850)$.

From Tables XIV and XV we have

$$E = E_{\odot} + \textit{its sec. var.} + E_{\Omega} + \textit{its sec. var,}$$

or, in time, $\frac{1}{15}$ of this value.

TABLE XVI gives for Washington mean noon of Jan. 0 in common years, Jan. 1 in bissextile years,

Arg. IV, the number of mean days elapsed since twice the moon's longitude was 0,

Arg. V, the number of days since the moon's mean anomaly ($\mathbb{C} - I'$) was 0, together with multiples of their periods.

TABLE XVII gives the terms in A and B, which depend on $2\,\mathbb{C}$ and $\mathbb{C} - I'$, viz:

$A_{\mathbb{C}} = -.00405 \sin 2\,\mathbb{C}$, $\quad B_{\mathbb{C}} = -0''.0886 \cos 2\,\mathbb{C}$

$A'_{\mathbb{C}} = +.00135 \sin (\mathbb{C} - I')$,

in units of the fifth decimal place for A, and of the fourth for B.

Arg. for $A_{\mathbb{C}}$ and $B_{\mathbb{C}}$, Arg. IV + d' + *day of year;*

Arg. for $A'_{\mathbb{C}}$, Arg. V + d' + *day of year;*

each diminished by the largest contained multiple of its period.

Reductions of right ascensions and declinations, which depend on $\mathbb{C}$ and $\mathbb{C} - I'$, are given in Tables XXXI — XXXIV.

TABLE XVIII contains for the epoch 1850, and for each tenth of the argument,

Arg. I + *its inequalities* + d' + *day of year*,

the logarithms of

$$C = -\,20''.4451 \cos\omega \cos\odot = -\,18''.7553 \cos\odot$$
$$D = -\,20''.4451 \sin\odot$$

The variation of log. C in 100 years is + 0.00004,25.

Changes of index in this table are indicated by :

TABLE XIX contains, for the same epoch and argument, H and the logarithms of h and i from the formulæ

$$h \sin H = C, \quad i = C \tan\omega = -\,8''.1389 \cos\odot$$
$$h \cos H = D$$

The variations in 100 years are

$$\delta H = +\,0'.17 \sin 2H, \qquad \delta.\log h = +\,0.00004{,}25 \sin^2 H$$
$$\delta.\log i = -\,0.0002{,}25.$$

The quantities A, B, C, D, E, or h, H, i, together with f, g, G from the formulæ,

$$f = mA + E, \qquad g\cos G = nA$$
$$g \sin G = B,$$

serve for reducing the mean right ascension and declination of a star at the beginning of the year to its apparent place at date.

If $\alpha_\circ$, $\delta_\circ$ are the star's mean right ascension and declination at the beginning of the year;

α, δ, the star's mean right ascension and declination, and

α', δ', the star's apparent right ascension and declination, for the time, τ, reckoned from the beginning of the year and expressed in fractional parts of a tropical year;

μ and μ', the annual proper motion of the star in right ascension and declination, respectively;

ω, the obliquity of the ecliptic, in Table VI;

m, n, the coefficients for precession in Table V;

and with BESSEL'S notation,

$$a = \tfrac{1}{15}(m + n \sin\alpha \tan\delta) \qquad a' = n\cos\alpha$$
$$b = \tfrac{1}{15}\cos\alpha\tan\delta \qquad b' = -\sin\alpha$$
$$c = \tfrac{1}{15}\cos\alpha\sec\delta \qquad c' = \tan\omega\cos\delta - \sin\alpha\sin\delta$$
$$d = \tfrac{1}{15}\sin\alpha\sec\delta \qquad d' = \cos\alpha\sin\delta$$

we have for the reduction to the apparent place at date, the formulæ,

$$\alpha' - \alpha_\circ = Aa + Bb + Cc + Dd + E + \tau\mu$$
$$\delta' - \delta_\circ = Aa' + Bb' + Cc' + Dd' + \tau\mu':$$

or the formulæ,

$$\alpha' - \alpha_\circ = f + g\sin(G+\alpha)\tan\delta + h\sin(H+\alpha)\sec\delta + \tau\mu$$
$$\delta' - \delta_\circ = g\cos(G+\alpha) + h\cos(H+\alpha)\sin\delta + i\cos\delta + \tau\mu'.$$

Except for stars of high declination, the mean right ascension and declination of the star, or the values of a, b, &c., for the beginning of the year, instead of their values for the date, may be used.

If greater accuracy is required the small terms in A and B from Tables XVII and XXXVI may be supplied; or instead of the former, the terms in the reductions of right ascension and declination in Tables XXXI — XXXIV: and for stars near the pole we may also add such of the following terms as may be of sufficient magnitude:

In *Right Ascension.*		In *Declination.*	
$+0^s.000003\ \tau^2 \sin\alpha$ $-0.000149\ \tau^2 \cos\alpha$	$\tan\delta$	$+0''.000975\ \tau^2 \sin^2\alpha$ $-0.000023 \sin 2\ \Omega$ $-0.000080 \cos 2\ \Omega \cos 2\alpha$ $-0.000077 \sin 2\ \Omega \sin 2\alpha$ $+0.000040 \cos 2\ \odot$ $-0.000467 \cos 2\ \odot \cos 2\alpha$ $-0.000465 \sin 2\ \odot \sin 2\alpha$	$\tan\delta$
$-0.0000650\ \tau^2 \sin 2\alpha$ $+0.0000103 \sin 2\ \Omega \cos 2\alpha$ $-0.0000107 \cos 2\ \Omega \sin 2\alpha$	$\tan^2\delta$		
$+0.0000620 \sin 2\ \odot \cos 2\alpha$ $-0.0000622 \cos 2\ \odot \sin 2\alpha$	$\sec^2\delta$		
$+0.0000513 \sin(\odot+\Omega) \cos 2\alpha$ $-0.0000507 \cos(\odot+\Omega) \sin 2\alpha$ $+0.0000097 \sin(\odot-\Omega) \cos 2\alpha$ $-0.0000053 \cos(\odot-\Omega) \sin 2\alpha$	$\tan\delta \sec\delta$	$-0.00004 \cos(\odot+\Omega)$ $-0.00038 \cos(\odot+\Omega) \cos 2\alpha$ $-0.00038 \sin(\odot+\Omega) \sin 2\alpha$ $-0.00038 \cos(\odot-\Omega)$ $-0.00004 \cos(\odot-\Omega) \cos 2\alpha$ $-0.00007 \sin(\odot-\Omega) \sin 2\alpha$	$\sin\delta \tan\delta$

TABLE XX, for the computation of the annual precession of a star in right ascension and declination, contains for the epoch 1850.0

$\triangle_0\alpha = 1^s.33709 \sin\alpha$, or its logarithm, and
$\triangle\delta = 20''.0564 \cos\alpha$,

the signs of which are given with the *hour* of the argument.

For any date t, expressed in years and parts of a year, the argument is the star's mean right ascension at that time;

$$\log. \triangle_0\alpha = \textit{its tab. value} - 0.00000{,}187\ (t - 1850);$$

the annual precession in right ascension is

$$\triangle\alpha = 3^s.07177 + \triangle_0\alpha \tan\delta + 0^s.00001{,}9\ (t - 1850),$$

in which δ is the star's mean declination at the time t;
and the annual precession in declination

$$\triangle\delta = \textit{tab. value} - 0''.000086 \cos\alpha\ (t - 1850.)$$

The table gives $-0''.0086 \cos\alpha$, the variation in 100 years of the tabular value of $\triangle\delta$. Its sign, as given in the table, must be changed when α is between 6^h and 18^h.

The variation of the annual precession in 100 years is

In *Right Ascension.*	In *Declination.*
$+0^s.00190$	$-0''.0086 \cos\alpha$
$+0.00650 \sin 2\alpha$	$-0.4480 \sin\alpha$
$-0.000573 \sin\alpha \tan\delta$	$-0.1950 \sin^2\alpha \tan\delta$
$+0.029868 \cos\alpha \tan\delta$	
$+0.013000 \sin 2\alpha \tan^2\delta$	

by which the annual precession found for one epoch may be reduced to another.

Adding to the annual precession the proper motion of the star referred to the same equinox and equator, we have the annual variation in right ascension and declination. The whole motion between two dates, t and t', may be found by multiplying the annual motion at the middle time, $\frac{1}{2}(t' + t)$, by $(t' - t)$ the number of years in the interval.

This table and these expressions are, however, not sufficiently rigorous for stars near the pole, for which it is necessary to take into consideration second and higher differences of the motion.

SPECIAL TABLES

For the Standard Stars of the American Ephemeris.

TABLE XXI contains the mean right ascensions and declinations for 1860.0 of the 198 fixed stars, whose apparent places are given in the *American Ephemeris*, commencing with the volume for 1865. The magnitudes, annual variations, (which include precession

and proper motion,) secular variations, or changes in 100 years of the annual variations, and proper motions are also given.

The differences of these places and annual variations from those employed in the *American Ephemeris* for 1865–1869 will be found in Table XXIX.

The places and proper motions of 48 northern circumpolar stars and 128 time stars have been taken from Dr. B. A. GOULD'S *Standard Places of Fundamental Stars, U. S. Coast Survey, Second Edition*, Washington, 1866; of α Canis Majoris, α Geminorum, (the mean of the components), α Canis Minoris, γ Draconis, and α Cephei, from WOLFERS' *Tabulæ Reductionum Astronomicarum*, Berlin, 1858: of β^1 Scorpii, η and β Draconis, and 61^1 Cygni, from a discussion of nearly all available observations by Mr. G. W. HILL, hereafter given; and of 13 stars south of — 40° dec. from the *British Nautical Almanac* for 1848. The magnitudes, except of the 13 southern stars, are ARGELANDER'S. Circumpolar stars are indicated by a *

The mean right ascension, or declination, of a star for any year t will be its

$$R.\,A.,\text{ or } Dec.,\text{ for } 1860.0 + [An.\ var. + sec.\ var. \times \tfrac{1}{200}(t - 1860)](t - 1860).$$

For a star near either pole it may be necessary also to include terms of the third and higher powers of the time. The coefficients of these terms for the northern circumpolar stars will be found in GOULD'S *Standard Places of Fundamental Stars* already referred to.

TABLES XXII and XXIII contain the mean places of the same stars for the beginning of each year from 1865–1872 and 1873–1880, respectively. The hours and minutes of right ascension are given only for the first year on each page; when the seconds exceed 60^s they must be diminished by the requisite number of multiples of 60^s, and the minutes increased by the same number. A similar remark applies to the degrees of declination.

The year is supposed to begin when the sun's mean longitude is 280°.

TABLES XXIV–XXVIII contain the quantities necessary to obtain, for any date from 1865 to 1880, the apparent places of as many of these stars as are not found in WOLFERS' *Tabulæ Reductionum*. Tables for α and δ Ursæ Minoris are also given; but WOLFERS' tables for the remaining 42 stars require no other appreciable change than for differences of mean place and proper motion.

TABLE XXIV contains for each star—

$$\triangle_{\odot}\alpha = A_{\odot}a + B_{\odot}b + Cc + Dd + \tau(a + \mu)$$
$$\triangle_{\odot}\delta = A_{\odot}a' + B_{\odot}b' + Cc' + Dd' + \tau(a + \mu')$$
$$\triangle_{\Omega}\alpha = A_{\Omega}a + B_{\Omega}b + E_{\Omega}$$
$$\triangle_{\Omega}\delta = A_{\Omega}a' + B_{\Omega}b'$$

in which the same notation is used as in pages iii and iv.

To $\triangle_{\odot}\alpha$ and $\triangle_{\odot}\delta$ have been added the small terms, given on page vi, which depend on τ^2 and $\odot$, and to $\triangle_{\Omega}\alpha$ and $\triangle_{\Omega}\delta$ those which depend on Ω, whenever they are of sufficient magnitude.

The first two of this set of quantities include precession and proper motion for the fractional part of the year denoted by τ, aberration and solar nutation; the other two comprise the principal terms of lunar nutation.

The times of the star's conjunction in right ascension with the true and mean suns, and, for a circumpolar star, of its opposition to the mean sun, are also given.

The meridian on which the mean sun is at the time its longitude is 280° is called the *fictitious* meridian for the following year; and the astronomical mean time of that instant at that meridian is Jan 0 0^h of common years, Jan. 1 0^h of bissextile years. The corresponding sidereal time is Jan. 0 $18^h\ 40^m$, or in bissextile years, Jan. 1 $18^h\ 40^m$.

$\triangle_{\odot}\alpha$ and $\triangle_{\odot}\delta$ are first given for the upper transit of the star at this meridian which immediately precedes, or follows, this date, according as the right ascension of the star is less, or greater, than $18^h\ 40^m$; and then for every tenth transit throughout the year.

They are the proper values for 1870, but may be reduced to any other year by adding to each $\frac{1}{10}(t - 1870) \times$ *its Var. in* 10 *years*, (t being the entire year, exclusive of the fractional part.)

The columns headed *Diff. for* 10 *days* are the first differential coefficients of $\Delta_{\odot}\alpha$ and $\Delta_{\odot}\delta$, respectively, with regard to the time, the unit of which is 10 days. Both the *Var. in* 10 *years* and the *Diff. for* 10 *days* are expressed in units of the last decimal place of the quantities to which they belong, and are given for the same dates.

$\Delta_{\mathfrak{Q}}\alpha$ and $\Delta_{\mathfrak{Q}}\delta$ are also given for the same first transit, and then for every hundredth transit of the same meridian in each year from 1865 to 1880.

The common argument given for both sets of quantities is the number of sidereal days from the star's first transit. But for $\Delta_{\odot}\alpha$ and $\Delta_{\odot}\delta$ are also given the calendar dates, both sidereal and mean,* the repetition of which for $\Delta_{\mathfrak{Q}}\alpha$ and $\Delta_{\mathfrak{Q}}\delta$ is unnecessary.

To the mean day is appended the fractional part expressing the astronomical mean time of the star's transit, the sidereal time being the star's right ascension. But, as the argument for a time of transit, the entire day only is to be regarded, whether sidereal or mean, and the part of a day neglected.

It is to be noted, however, that in bissextile years the dates of the months January and February, as given in the table, should be increased by one day.

The quantities in this table, being given for the time of the upper transit of the star at the fictitious meridian, may be reduced to the time of transit at any other meridian for the same date, by interpolating for its longitude from the fictitious meridian of the year; which, expressed in days, is $k' + d'$ of Tables VI and I.†

And for the n^{th} transit at that meridian after any tabular date the interval for interpolation will be $n + k' + d'$. For a back interpolation n is negative.

1. If then the apparent place of a star is required for the time of its upper transit of any meridian on a specified day, the argument with which to enter the table for the star will be

The *sid. day* $+ k' + d'$, for the column *Sidereal Day;*
or, except in the case hereafter mentioned,

The *mean day* $+ k' + d'$, for the column *Mean Day,*
(neglecting, however, the fraction of a day in this column.)

On the mean day when the star is in conjunction with the mean sun there will be two transits, the first occurring near the commencement, the other near the close of the day; and it will be necessary to state which is meant.

The preceding argument applies to the first of these in a forward interpolation. For the other, and for the succeeding transits in the period of ten days in which the conjunction occurs, that is, after the conjunction and until the next tabular date, the argument should be

The *mean day* $+ k' + d' + 1^{\text{d}}$.

So also for a back interpolation, the argument, as first stated, applies to the second of the two transits, which occur on the day of conjunction. For the first, and for the preceding transits until the next preceding tabular date, the argument should be

The *mean day* $+ k' + d' - 1^{\text{d}}$.

But it may be more convenient, when the mean day is given, to reduce it to the sidereal day, by adding to it

1^{d}, before ♂ * *Mean Sun*,	}	if $\alpha < 18^{\text{h}}\,40^{\text{m}}$.
2^{d}, after " "		
0^{d}, before " "	}	if $\alpha > 18^{\text{h}}\,40^{\text{m}}$.
1^{d}, after " "		

* Jan.—0 76, at the top of col. *Mean day*, on p. 92, is Dec. 30.24, or in bissextile years, Dec. 31.24, of the preceding year. Other negative dates are to be regarded in the same way.

† $k' + d'$ sometimes exceeds 1^{d}, or the whole circumference. It should, however, be used without any reduction.

Then by adding $k' + d'$ we have the argument* to be used with the column *sidereal day*.

On the day of conjunction the first of the two transits is before, the second is after, the time of conjunction.

2 If the apparent place of a circumpolar star at the time of its lower transit on any day is wanted, the argument to be used with the column *sidereal day* will be

The sid. day $+ k' + d' + 0^d.5$, if $\alpha < 12^h$,
The sid. day $+ k' + d' - 0^d.5$, if $\alpha > 12^h$;

or

The mean day $+ k' + d' + 1^d.5$, before $\odot$ * *Mean Sun*,
The mean day $+ k' + d' + 2^d.5$, after " } if $\alpha < 6^h\ 40^m$.

The mean day $+ k' + d' + 0^d.5$, before "
The mean day $+ k' + d' + 1^d.5$, after " } if $\alpha > 6^h\ 40^m$.

Two lower transits occur on the mean day of the star's opposition to the mean sun. The remarks respecting two transits on the same day apply here as in the case of upper transits.

The argument for a lower transit to be used with the column *Mean Day*, excluding as before the fractional part af a day in that column, will be

The mean day $+ k' + d' - 0^d.5$,

from the conjunction to the succeeding opposition with the mean sun;

The mean day $+ k' + d' + 0^d.5$,

from the opposition to the succeeding conjunction; with the same modification, however, at the date of two transits, as in the case of an upper culmination.

3. For a specified sidereal time, *sid. day* $+ s$, the argument will be

The sid. day $+ k' + d' + (s - \alpha)$,

in which convenience requires that $s - \alpha$ should be expressed in decimals of a day.

4. For a specified mean time, the argument, with which to enter the column *Mean Day*, will be

The mean time $+ k' + d'$;

and the fractional part of the day in this column must be taken into account.† For $\Delta_{\leftrightarrows}\alpha$ and $\Delta_{\leftrightarrows}\delta$ the column of *Mean Day* is easily supplied from columns one and two of the table.

Forming the argument in either of these cases and taking the nearest, or the next preceding, tabular date, let

$$T = \tfrac{1}{10}(Arg. - Tab.\ date \text{ for } \Delta_{\odot}\alpha \text{ and } \Delta_{\odot}\delta),$$
$$T_1 = \tfrac{1}{100}(Arg. - Tab.\ date \text{ for } \Delta_{\leftrightarrows}\alpha \text{ and } \Delta_{\leftrightarrows}\delta).$$

T will be the coefficient by which to multiply the *Diff. for* 10 *days* of $\Delta_{\odot}\alpha$, $\Delta_{\odot}\delta$, and their *Var. in* 10 *years*;

T_1, the coefficient of the *Diff. for* 100 *days* of $\Delta_{\leftrightarrows}\alpha$ and $\Delta_{\leftrightarrows}\delta$; and $\frac{1}{2}\ T^2$ and $\frac{1}{2}\ T_1^2$, respectively, the coefficients of the second differences of the two sets of quantities; provided the first differences, like the *Diff. for* 10 *days* of $\Delta_{\odot}\alpha$ and $\Delta_{\odot}\delta$ in the table, are reduced‡ to the tabular date employed.

If we use as 2d difference the mean of the differences of the *Diff. for* 10 *days*, or the *Diff. for* 100 *days*, which immediately precede and follow the tabular date, $\frac{1}{6}\ T^3$ and

* This also is the argument for the similar tables of BESSEL'S *Tabulæ Regiomontanae and* WOLFERS' *Tabulæ Reductionum.*

† The mean time interval in this case, *Arg. — Tab. date*, should be increased by $\frac{1}{400}$ part.

‡ This is done with sufficient exactness by subtracting from the mean of the 1st differences, which immediately precede and follow the date, one-sixth of the corresponding third differences; *i. e.*

$\Delta'_0 = \frac{1}{2}(\Delta'_{-1} + \Delta'_1) - \frac{1}{12}(\Delta'''_{-1} + \Delta'''_{-})$.

$\frac{1}{6}\ T_1{}^3$ will be, respectively, the coefficients of the 3d difference, which it is sometimes necessary to take into account. But if the nearest tabular date is used, T or T_1 will be numerically less than $\frac{1}{2}$, and the coefficient of the 3d difference will be less than $\frac{1}{48}$.

Adding the several products, indicated above, to the primary quantities to which they belong, we shall have $\triangle_{\odot}\alpha$, $\triangle_{\odot}\delta$, the *Var. in* 10 *years* of each, $\triangle_{\mathfrak{Q}}\alpha$ and $\triangle_{\mathfrak{Q}}\delta$ reduced to the specified time. Then, if

α_0 and δ_0 are the mean right ascension and declination of the star at the beginning of the year,

α' and δ', its apparent right ascension and declination at the stated time,

the required apparent place of the star is found by the following formulæ:

$$\alpha' = \alpha_0 + \triangle_{\odot}\alpha + \textit{its Var. in } 10\ y. \times \tfrac{1}{10}\,(t - 1870) + \triangle_{\mathfrak{Q}}\alpha,$$
$$\delta' = \delta_0 + \triangle_{\odot}\delta + \textit{its Var. in } 10\ y. \times \tfrac{1}{10}\,(t - 1870) + \triangle_{\mathfrak{Q}}\delta;$$

to which, however, should be added in the case of several circumpolar stars several small terms supplied by subsequent tables; and, for other stars also, the terms depending on $\mathfrak{C}$ and $\mathfrak{C} - I'$, when they are regarded as of sufficient importance.

The essential features of this table belong also to the corresponding tables of BESSEL'S *Tabulæ Regiomontanæ* and WOLFERS' *Tabulæ Reductionum*. The peculiar arrangement with respect to the argument, employed first by BESSEL, presents this great advantage, that the argument and coefficients for interpolation are the same for all stars at their respective times of transits over the same meridian on the same sidereal day; that is, from 0^h of sidereal time until the succeeding 0^h. And for each successive sidereal day the argument increases by 1 day.

In constructing an ephemeris of the stars, for each tenth transit, like that of the *American Ephemeris*, the coefficients for interpolation are the same for every date throughout the year, as well as every star, viz:

$$T = \tfrac{1}{10}\,(k' + d'), \qquad T_1 = \tfrac{1}{100}\,(k' + d');$$

or, if it is desired that the ephemeris shall commence n days later,

$$T = \tfrac{1}{10}\,(n + k' + d'), \qquad T_1 = \tfrac{1}{100}\,(n + k' + d').$$

Thus for 1868 and the meridian of Washington, to commence Jan. 1,

$$1^d + k' + d' = +\ 1^d.649, \qquad T = +\ 0.1649, \qquad T_1 = +\ 0.01649;$$

and for 1870, to commence Jan. 0.

$$1^d + k' + d' = +\ 1^d.164, \qquad T = +\ 0.1164, \qquad T_1 = +\ 0.01164.$$

To the numbers in the column *Mean Day* we may simply add n, or more rigidly $n - .00274\ (n + k' + d')$.

TABLE XXV contains for 51 Cephei, σ Octantis, and λ Ursæ Minoris terms in right ascension and declination to be multiplied by $\frac{1}{100}\,(t - 1870)^2$; that is, a secular variation of the secular variation. The argument is the same as for $\triangle_{\odot}\alpha$ and $\triangle_{\odot}\delta$ in Table XXIV.

TABLE XXVI contains, also for the same argument, the motion of $\odot + \mathfrak{Q}$ and $\odot - \mathfrak{Q}$, expressed in thousandths of the circumference.

TABLE XXVII contains for α Ursæ Minoris, 51 Cephei, σ Octantis, and λ Ursæ Minoris, terms in right ascension and declination, (on page vi,) which depend on $\odot + \mathfrak{Q}$ and $\odot - \mathfrak{Q}$. The argument is $\odot + \mathfrak{Q}$, or $\odot - \mathfrak{Q}$, as given on page 249 for the star at the beginning of the year, + the motion for the date in Table XXVI; rejecting 1000 when the sum exceeds that number. The sign to be used is that written on the same side as the argument.

TABLE XXVIII contains for α Ursæ Minoris, 51 Cephei, δ Ursæ Minoris, and λ Ursæ Minoris, terms which depend on $2\ \mathfrak{C}$, viz:

$$\triangle_{\mathfrak{C}}\alpha = -\ 0^s.0125 \sin 2\ \mathfrak{C} - [0^s.00542 \sin 2\ \mathfrak{C} \sin \alpha + 0^s.00590 \cos 2\ \mathfrak{C} \cos \alpha] \tan \delta$$
$$\triangle_{\mathfrak{C}}\delta = -\ 0''.0813 \sin 2\ \mathfrak{C} \cos \alpha + 0''.0886 \cos 2\ \mathfrak{C} \sin \alpha.$$

The "argument 2 ☾" is the number of sidereal days since 2 ☾ = 0. It is given for the beginning of each fictitious year on page 253, and is formed for any date by adding to the argument for the year, the argument for $\Delta_{\odot}\alpha$, &c., in Table XXIV, expressed in sidereal days, *i. e.*

The sid. day $+ k' + d'$, for the upper transit,
The sid. day $+ k' + d' + (s - \alpha)$, for any sidereal time;

and subtracting the largest contained multiple of the period. As in Table XXIV, the argument is the same for the four stars at their transits over the same meridian on the same sidereal day..

The terms are given for every tenth of a sidereal day, an interval sufficiently small to dispense with interpolation. It will be noticed, however, that the table is arranged so that there is an interval of a sidereal day, instead of a tenth of a day, in the argument; so that, starting with the argument for the commencement of a daily ephemeris, we have only to write down the numbers from the proper column of the table, in the order in which they are given; and, when we arrive at the end of the table, to go back to the beginning, and so on until the period of the ephemeris is completed. This advantage is afforded by the fact that the period of the argument is 13.698 sidereal days, so that, assuming it as 13.7 days, will, after a whole year, make the argument in error less than $0^d.05$. If we add $0^d.025$ to the argument at the beginning of the year, the arguments obtained for the middle of the year will be correct; and at the beginning and end will be in error less than $0^d.03$.

Thus for the upper transit of α Urs\æ Minoris at the meridian of Washington, 1870, Jan. 1.

Arg. 2 ☾ + *sid. day* $+ k' + d' = 5^d.88 + 2^d + 0^d.16 = 8^d.04$, and adding $0^d.025$, we have $8^d.1$ as the argument with which to commence.

TABLE XXIX contains the reductions of the places of the stars, as given in the *American Ephemeris* for the years 1865–1869, to those adopted in these tables and in the *Ephemeris* for 1870. The epoch is 1865.

TABLE XXX gives for the beginning of each year Dr. AUWERS'* correction of the position of α Canis Majoris, *Sirius*, due to orbital motion, viz:

$$q = +0^s.0647 - 0^s.000718\,(t - 1860) + 0^s.1510 \cos (u + 1^\circ\ 6')$$
$$r = -0''.630 - 0''.00044\ (t - 1860) + 1''.445 \sin (u + 23^\circ\ 30')$$

in which u, the eccentric anomaly from the inferior apsis, is found by the formulæ

$$u - e \sin u = n\,(t - T),$$

from the elements

$T = 1793.830$, passage through the inferior apsis,
$e = 0.6010$, the eccentricity,
$n = 7^\circ.28475$, mean annual motion in orbit,
$49^y.418$, period of revolution.

It is substituted for the *Tabula Subsidiaria* of WOLFERS.

SUPPLEMENTARY TABLES,

Of small terms in nutation.

TABLES XXXI and XXXIII contain terms in the reduction of mean right ascensions and declinations, which depend on 2 ☾, viz:

$$\Delta'_{☾}\alpha = -0^s.0125 \sin 2\,☾.$$
$$\Delta''_{☾}\alpha \div \tan\delta = -0^s.00542 \sin 2\,☾ \sin\alpha - 0^s.00590 \cos 2\,☾ \cos\alpha$$
$$\Delta'_{☾}\delta = -0''.0813 \sin 2\,☾ \cos\alpha + 0''.0886 \cos 2\,☾ \sin\alpha$$

The arguments are,

Side Arg. = *Arg. IV* (Table XVI) $+ d'$ + *day of year*,
Hor. Arg. = α,

* *Astronomische Nachrichten*, vol. 63, No. 1506.

subtracting from the former the largest contained multiple of the period. The signs of $\Delta''_{\mathfrak{C}}\alpha$ and $\Delta'_{\mathfrak{C}}\delta$, as given in the table, are to be changed when $\alpha > 12^h$.

TABLES XXXII and XXXIV contain terms which depend on $\mathfrak{C} - I'$, viz:

$$\Delta'''_{\mathfrak{C}}\alpha = +\,0^s.0041 \sin(\mathfrak{C} - I')$$

$$\Delta^{iv}_{\mathfrak{C}}\alpha \div \tan\delta = +\,0^s.00180 \sin(\mathfrak{C} - I') \sin\alpha$$

$$\Delta''_{\mathfrak{C}}\delta = +\,0''.0270 \sin(\mathfrak{C} - I') \cos\alpha$$

The arguments are,

Side Arg. = *Arg. V* (Tab. XVI) + d' + *day of year.*
Hor. Arg. = α.

The signs of $\Delta^{iv}_{\mathfrak{C}}\alpha$ and $\Delta''_{\mathfrak{C}}\delta$, as given in the table, are to be changed, when α is found at the bottom.

TABLE XXXV contains for Washington mean noon of Jan. 0 in common years, Jan. 1 in bissextile years, arguments for small terms in nutation, viz:

Arg.	VI,	for terms in	$2\odot - \Omega$, with its inequalities.
Arg.	VII,	"	$2\odot - 2\Omega$ "
Arg.	VIII,	"	$2\odot - 2I'$ "
Arg.	IX,	"	$2I' - \Omega$
Arg.	X,	"	I'

In each case the argument is the number of mean days since the quantity was 0. The period of each is also given.

TABLE XXXVI contains the following small terms:

In *A*.	In *B*.		
$-.00011 \sin(3\odot - I')$,*	$-0.0027 \cos(3\odot - I')$,*	For *Arg.*	I.
$+.00025 \sin(2\odot - \Omega)$,	$+0.0067 \cos(2\odot - \Omega)$,	"	VI.
$-.00005 \sin 2(\odot - \Omega)$,		"	VII.
$+.00010 \sin 2(\odot - I')$,		"	VIII.
$+.00009 \sin(2I' - \Omega)$,	$+0.0024 \cos(2I' - \Omega)$,	"	IX.
$+.00005 \cos I'$ } $+.00004 \sin 2I'$ }	$-0.0023 \sin I'$ } $+0.0008 \cos 2I'$ }	"	X.

They are expressed in the table in units of the *fifth* decimal place for *A*, and of the *fourth* for *B*.

The Argument in each case will be the *Argument* for the beginning of the year, from Table VI or XXXV, + *its inequalities* + d' + *day of the year*, diminished by the largest contained multiple of its period.

EXAMPLES.

1. Required, for Washington mean midnight July 12, 1868, the obliquity of the ecliptic, the equation of equinoxes in longitude and right ascension, and the quantities *A*, *B*, *C*, *D*, *E*, *f*, *g*, *G*, *h*, *H* and *i*.

FORMULÆ USED IN THE CONSTRUCTION OF THE TABLES.

Many of the formulæ used in the construction of the tables have been given in the preceding pages. Others, however, could not be conveniently introduced.

Table VI. From HANSEN and OLUFSEN'S *Tables du Soleil*, Intr. p. 12, we have for Paris mean noon of Jan. 0 in a common year, Jan. 1 in a bissextile year,

$$\text{Arg. I} = 1.905307 - \tfrac{1}{4} r + 0.00721714\,(t' - 1850) + 0.00000003101\,(t' - 1850)^2,$$
$$\text{Arg. V} = 2.3470 + 0.0053032\,(t' - 1850.)$$

t' being the entire number of the year, and r the remainder after its division by 4.

From PEIRCE'S *Tables of the Moon*, Intr. p. 5, we have

$$\Omega = 13^{\circ}\ 55'\ 52''.6 - 190''.63366070\, i + 6''.0355 \frac{i^2}{10^9} + 2''.3744 \frac{i^3}{10^{16}},$$

in which i denotes the number of mean solar days from 1801, Jan. 0 0^{h}, mean time of Washington. From this we readily find

$$\text{Arg. III} = -263^{d}.0838 + i - 6798^{d}.37965\, n - 0^{d}.001463\, n^2,$$

n denoting a whole number, so taken that Arg. III may be numerically less than 3399^{d}.2, or half the period.

* The value of 100 C in GOULD'S *Standard Places*, page 6.

According to BESSEL (*Astronomische Nachrichten*, No. 134,) the mean longitude of the sun for mean noon of Paris of Jan. 0 in common years, Jan. 1 in bissextile years, of the year $1800 + t$ is

$$279^\circ\ 54'\ 1''.36 + 27''.605844\ t + 0''.0001221805\ t^2 - 14'\ 47''.083\ f,$$

where f denotes the remainder after dividing t by 4, and the mean daily motion of the sun is $59'\ 8''.3302$. Whence for mean noon of Washington,

$$k = +2^h\ 52^m\ 0^s.0 + 11^m\ 12^s.18798\ t + 0^s.002975\ t^2 - 6^h \times f.$$
$$k' = +0^d.11944447 + 0^d.0077799535\ t + 0^d.000000034433\ t^2 - \tfrac{1}{4}f.$$
$$k'' = +0^y.00032703 + 0^y.000021350\ t - 0^y.00068448\ f.$$

Table XVI. From PEIRCE'S *Tables of the Moon* we also have

$$\mathfrak{C} = 107^\circ\ 55'\ 40''.5 + 47435''.02808897\ i + 8''.598\ \frac{i^2}{10^9} + 3''.6483\ \frac{i^3}{10^{16}}$$
$$I' = 266\ \ 4\ 51.3 + 401.05783886\ i - 27.217\ \frac{i^2}{10^9} - 13.750\ \frac{i^3}{10^{16}};$$

whence

$$\mathfrak{C} - I' = 201^\circ\ 50'\ 49''.2 + 47033''.97025011\ i + 35''.815\ \frac{i^2}{10^9} + 17''.398\ \frac{i^3}{10^{16}}$$
$$\text{Arg. IV} = 8^d.19101 + i - 13^d.6607909\ n + 0^d.033826\ \frac{n^2}{10^9},$$
$$\text{Arg. V} = 15.4493 + i - 27.5545524\ n + 0.57815\ \frac{n^2}{10^9}.$$

in which i denotes the number of mean days from Washington mean noon of 1801, Jan. 0, and n is a whole number denoting in each case the number of entire periods of the argument.

Table XXXV. From the preceding values of $\odot$, $\mathfrak{Q}$ and I' are derived,

Arg. VI =	$91^d.800 + i - 177^d.84380\ n$	for terms in $2\odot - \mathfrak{Q}$
Arg. VII =	$82.753 + i - 173.31004\ n$	" $2(\odot - \mathfrak{Q})$
Arg. VIII =	$15.783 + i - 205.89262\ n$	" $2(\odot - I')$
Arg. IX =	$573.790 + i - 1305.4655\ n$	" $2I' - \mathfrak{Q}$
Arg. X =	$2388.412 + i - 3231.455\ n$	" I'

in which i is reckoned from the same epoch as before.

Tables XXI — XXVIII.

ON THE DERIVATION AND REDUCTION OF PLACES OF THE FIXED STARS,

By Mr. G. W. HILL, *Assistant in Nautical Almanac Office.*

The co-ordinates of the stars are affected by three distinct causes; first, by the motion of the earth's axis and the equinox, which produces precession and nutation; second, by the motion of the star itself and of the solar system in space, the combined effect of which is denoted as proper motion; third, by the motion of light, the effect of which is called aberration.

1. Let us first consider the effect of precession alone. If α and δ denote the right ascension and declination of a star at any time, its rectangular co-ordinates will be, its distance being assumed as unity,

$$\left.\begin{aligned} x &= \cos\delta\cos\alpha, \\ y &= \cos\delta\sin\alpha, \\ z &= \sin\delta. \end{aligned}\right\} \qquad (1)$$

To pass to any new system we shall have the known equations

$$\left.\begin{aligned} x' &= ax + by + cz, \\ y' &= a'x + b'y + c'z, \\ z' &= a''x + b''y + c''z. \end{aligned}\right\} \qquad (2)$$

But in the case where we wish to obtain the differentials of x, y, z for an infinitesimal time dt, a, b', and c'' are each unity, being the cosines of angles infinitely small; and all the other constants will contain dt as a factor. Hence we may write

$$\left.\begin{aligned}\frac{dx}{dt} &= by + cz,\\ \frac{dy}{dt} &= a'x + c'z,\\ \frac{dz}{dt} &= a''x + b''y.\end{aligned}\right\} \quad (3)$$

The equation $x^2+y^2+z^2=1$, gives us $x\frac{dx}{dt}+y\frac{dy}{dt}+z\frac{dz}{dt}=0$. Substituting in this the above values of $\frac{dx}{dt}$, &c., there result these three equations of condition between the six remaining constants,

$$\left.\begin{aligned}b + a' &= 0,\\ c + a'' &= 0,\\ c' + b'' &= 0.\end{aligned}\right\} \quad (4)$$

Hence

$$\left.\begin{aligned}\frac{dx}{dt} &= by + cz,\\ \frac{dy}{dt} &= -bx + c'z,\\ \frac{dz}{dt} &= -cx - c'y.\end{aligned}\right\} \quad (5)$$

It belongs to Celestial Mechanics to deduce the values of the three remaining coefficients of these equations. When precession alone is considered $c'=0$, and $-b$ and $-c$ are the quantities m and n, whose values have been previously given. Thus we have, the unit of t being one year,

$$\left.\begin{aligned}\frac{dx}{dt} &= -my - nz,\\ \frac{dy}{dt} &= mx,\\ \frac{dz}{dt} &= nx.\end{aligned}\right\} \quad (6)$$

If the values of x, y, and z are now substituted in these equations we readily find that

$$\left.\begin{aligned}\frac{d\alpha}{dt} &= m + n\sin\alpha\tan\delta,\\ \frac{d\delta}{dt} &= n\cos\alpha.\end{aligned}\right\} \quad (7)$$

Differentiating these and always eliminating $\frac{d\alpha}{dt}$ and $\frac{d\delta}{dt}$ by means of the primitive equations we obtain

$$\left.\begin{aligned}
\frac{d^2\alpha}{dt^2} &= \frac{dm}{dt} + \frac{n^2}{2}\sin 2\alpha + \left[\frac{dn}{dt}\sin\alpha + mn\cos\alpha\right]\tan\delta + n^2\sin 2\alpha\tan^2\delta;\\
\frac{d^2\delta}{dt^2} &= -mn\sin\alpha + \frac{dn}{dt}\cos\alpha - n^2\sin^2\alpha\tan\delta;\\
\frac{d^3\alpha}{dt^3} &= \frac{mn^2}{2} + \tfrac{3}{2}mn^2\cos 2\alpha + \tfrac{3}{2}n\frac{dn}{dt}\sin 2\alpha\\
&\quad + \left\{(2n^2 - m^2 + 3n^2\cos 2\alpha)\,n\sin\alpha + \left(2m\frac{dn}{dt} + n\frac{dm}{dt}\right)\cos\alpha\right\}\tan\delta\\
&\quad + \left\{3mn^2\cos 2\alpha + 3n\frac{dn}{dt}\sin 2\alpha\right\}\tan^2\delta\\
&\quad + 2n^3\sin\alpha\,(1 + 2\cos 2\alpha)\tan^3\delta,\\
\frac{d^3\delta}{dt^3} &= -\left(2m\frac{dn}{dt} + n\frac{dm}{dt}\right)\sin\alpha - (m^2 + n^2\sin^2\alpha)\,n\cos\alpha\\
&\quad - \left\{\tfrac{3}{2}mn^2\sin 2\alpha + 3n\frac{dn}{dt}\sin^2\alpha\right\}\tan\delta - 3n^3\sin^2\alpha\cos\alpha\tan^2\delta.
\end{aligned}\right\} \quad (7)$$

The right ascension and declination of a star so far as regards precession are then found by the formulæ

$$\left.\begin{aligned} \alpha &= \alpha_0 + \left(\frac{d\alpha}{dt}\right)_0 t + \tfrac{1}{2}\left(\frac{d^2\alpha}{dt^2}\right)_0 t^2 + \tfrac{1}{2.3}\left(\frac{d^3\alpha}{dt^3}\right)_0 t^3 + \text{\&c.}, \\ \delta &= \delta_0 + \left(\frac{d\delta}{dt}\right)_0 t + \tfrac{1}{2}\left(\frac{d^2\delta}{dt^2}\right)_0 t^2 + \tfrac{1}{2.3}\left(\frac{d^3\delta}{dt^3}\right)_0 t^3 + \text{\&c.} \end{aligned}\right\} (8)$$

2. Let us next consider the effect of proper motion. If the values of $\frac{d\alpha}{dt}$ and $\frac{d\delta}{dt}$ for any star are obtained from observation for a certain epoch, we may compute the functions $m + n \sin \alpha \tan \delta$, and $n \cos \alpha$, and subtract them from these quantities; the remainders μ and μ' are the effect of proper motion in right ascension and declination at that epoch. But to deduce the values of μ and μ' for any time in general, we may adopt the assumption that the proper motion is uniform on the arc of a great circle, and on this supposition derive the rigorous values of the differential coefficients of α and δ with respect to the time.

Considering now the effect of proper motion only, let

ρ denote the velocity of the star's motion on the arc of a great circle,
χ, the angle of position of this arc,
α' and δ', the right ascension and declination of the star at the end of the time t.

The consideration of the spherical triangle formed by the pole of the equator and the two positions of star, will give these equations

$$\left.\begin{aligned} \sin \delta' &= \sin \delta \cos \rho\, t + \cos \delta \sin \rho\, t \cos \chi, \\ \cos \delta' \cos (\alpha' - \alpha) &= \cos \delta \cos \rho\, t - \sin \delta \sin \rho\, t \cos \chi, \\ \cos \delta' \sin (\alpha' - \alpha) &= \sin \rho\, t \sin \chi. \end{aligned}\right\} (9)$$

Eliminating ρ and χ by means of the equations

$$\rho \sin \chi = \mu \cos \delta, \qquad \rho \cos \chi = \mu',$$

we derive from the first and third of the preceding equations the following values of α' and δ' in series arranged according to the powers of t:

$$\left.\begin{aligned} \alpha' &= \alpha + \mu\, t + \mu\, \mu' \tan \delta.\ t^2 - \tfrac{1}{3}\left[\mu^3 \sin^2 \delta - \mu\, \mu'^2 (1 + 3 \tan^2 \delta)\right] t^3 + \text{\&c.} \\ \delta' &= \delta + \mu' t - \tfrac{1}{4} \mu^2 \sin 2\delta.\ t^2 - \tfrac{1}{6} \mu^2 \mu' (1 + 2 \sin^2 \delta)\, t^3 + \text{\&c.} \end{aligned}\right\} (10)$$

3. In order to have the combined effect of precession and proper motion, α' and δ' should be substituted for α and δ in the series which give the effect of precession. Hence we obtain

$$\left.\begin{aligned} \frac{d\alpha}{dt} &= m + n \sin \alpha \tan \delta + \mu, \\ \frac{d\delta}{dt} &= n \cos \alpha + \mu'; \end{aligned}\right\} (11)$$

and, μ and μ' being considered as variable quantities,

$$\left.\begin{aligned} \frac{d\mu}{dt} &= n\, \mu \cos \alpha \tan \delta + n\, \mu' \sin \alpha \sec^2 \delta + 2\, \mu\, \mu' \tan \delta, \\ \frac{d\mu'}{dt} &= -\, n\, \mu \sin \alpha - \tfrac{1}{2} \mu^2 \sin 2\delta. \end{aligned}\right\} (12)$$

By differentiating the values of $\frac{d\alpha}{dt}$ and $\frac{d\delta}{dt}$, and eliminating $\frac{d\alpha}{dt}$, $\frac{d\delta}{dt}$, $\frac{d\mu}{dt}$ and $\frac{d\mu'}{dt}$, by means of their values just given, we obtain

$$
\left.\begin{aligned}
\frac{d^2\alpha}{dt^2} &= \frac{dm}{dt} + \frac{n^2}{2}\sin 2\alpha + 2n\mu'\sin\alpha \\
&\quad + \left\{ \frac{dn}{dt}\sin\alpha + (m+2\mu)\, n\cos\alpha + 2\mu\mu' \right\}\tan\delta \\
&\quad + 2n\sin\alpha\,(n\cos\alpha + \mu')\tan^2\delta; \\
\frac{d^3\alpha}{dt^3} &= \frac{mn^2}{2} + 2\mu\mu'^2 + 3\frac{dn}{dt}\mu'\sin\alpha + 3n\mu'(m+2\mu)\cos\alpha + \tfrac{3}{2}(m+2\mu)n^2\cos 2\alpha \\
&\quad + \tfrac{3}{2}n\frac{dn}{dt}\sin 2\alpha - 2\mu^3\sin^2\delta \\
&\quad + \left\{ \begin{array}{l} (2n^2 - m^2 - 6\mu^2 + 6\mu'^2 - 3m\mu + 3n^2\cos 2\alpha)\, n\sin\alpha \\ + (2m\frac{dn}{dt} + n\frac{dm}{dt} + 3\frac{dn}{dt}\mu)\cos\alpha + 6n^2\mu'\sin 2\alpha \end{array} \right\}\tan\delta \\
&\quad + \left\{ \begin{array}{l} 6\mu\mu'^2 + 3\frac{dn}{dt}\mu'\sin\alpha + (12\mu + 3m)\, n\mu'\cos\alpha \\ + 3n\frac{dn}{dt}\sin 2\alpha + (3m + 6\mu)\, n^2\cos 2\alpha \end{array} \right\}\tan^2\delta \\
&\quad + \left\{ (2n^2 + 6\mu'^2)\, n\sin\alpha + 6n^2\mu'\sin 2\alpha + 4n^3\sin\alpha\cos 2\alpha \right\}\tan^3\delta, \\
\frac{d^3\delta}{dt^3} &= -\mu^2\mu' - (2m+3\mu)\frac{dn}{dt}\sin\alpha - (m^2 + 3\mu^2 + 3m\mu)\, n\cos\alpha \\
&\quad - n\frac{dm}{dt}\sin\alpha - n^3\sin^2\alpha\cos\alpha - 3n^2\mu'\sin^2\alpha - 2\mu^2\mu'\sin^2\delta \\
&\quad - \left\{ 6n\mu\mu'\sin\alpha + \tfrac{3}{2}(m+2\mu)\, n^2\sin 2\alpha + 3n\frac{dn}{dt}\sin^2\alpha \right\}\tan\delta \\
&\quad - 3n^2(n\cos\alpha + \mu')\sin^2\alpha\tan^2\delta.
\end{aligned}\right\} (13)
$$

The values of α and δ computed by means of Maclaurin's theorem, using the above values of the differential coefficients, will give the mean place of the star.

For the epoch 1860, by substituting the proper numerical values of m and n, from Table V, expressing $\frac{d\alpha}{dt}$, $\frac{d^2\alpha}{dt^2}$ and μ in seconds of time, $\frac{d\delta}{dt}$, $\frac{d^2\delta}{dt^2}$ and μ' in seconds of arc, and denoting that the logarithm of the number is expressed by writing it in [ ], we have the formulæ

$$
\left.\begin{aligned}
\frac{d\alpha}{dt} &= 3^s.071960 + [0.1261427]\sin\alpha\tan\delta + \mu, \\
100\frac{d^2\alpha}{dt^2} &= 0^s.003221 - [6.63378]\left(\frac{d\alpha}{dt} - \mu\right) + [7.987809]\left(\frac{d\alpha}{dt} + \mu\right)\cos\alpha\tan\delta \\
&\quad + [6.811718]\left(\frac{d\delta}{dt} + \mu'\right)\sin\alpha\sec^2\delta + [6.9866]\,\mu\mu'\tan\delta, \\
\frac{d\delta}{dt} &= [1.3022340]\cos\alpha + \mu', \\
100\frac{d^2\delta}{dt^2} &= -[6.63378]\left(\frac{d\delta}{dt} - \mu'\right) - [9.163900]\left(\frac{d\alpha}{dt} + \mu\right)\sin\alpha - [8.7367]\,\mu^2\sin 2\delta
\end{aligned}\right\} (14)
$$

By these formulæ the quantities in Table XXI have been computed.

The last term of $\frac{d^2\alpha}{dt^2}$ and also that of $\frac{d^2\delta}{dt^2}$ are nearly always insensible.

The above expressions for $\frac{d^3\alpha}{dt^3}$ and $\frac{d^3\delta}{dt^3}$ are too complicated for use in computation; hence if their values are wanted, it will be much easier to compute the values of the second differential coefficients for 50 years before and after the epoch, and divide the differences of these by 100 for the values of the third differential coefficients at the epoch.

4. We have next to consider the effect of nutation. Resuming the equations

After line 10, insert

$$\frac{d^2\delta}{dt^2} = -(m+2\mu)\, n\sin\alpha + \frac{dn}{dt}\cos\alpha - \tfrac{1}{2}\mu^2\sin 2\delta - n^2\sin^2\alpha\tan\delta$$

$$\left.\begin{aligned} \frac{dx}{dt} &= \quad by + cz, \\ \frac{dy}{dt} &= -bx + c'z, \\ \frac{dz}{dt} &= -cx - c'y, \end{aligned}\right\} \qquad (5)$$

putting for x, y and z their values from (1) in terms of α and δ, and writing $\triangle\alpha$ and $\triangle\delta$ instead of $\frac{d\alpha}{dt}$ and $\frac{d\delta}{dt}$ we obtain

$$\left.\begin{aligned} \triangle\alpha &= -b - c \sin\alpha \tan\delta + c' \cos\alpha \tan\delta, \\ \triangle\delta &= -c \cos\alpha - c' \sin\alpha. \end{aligned}\right\} \qquad (15)$$

We may make

$$\left.\begin{aligned} b &= -mA' - E, \\ c &= -nA', \\ c' &= B, \end{aligned}\right\} \qquad (16)$$

where B and E denote the same quantities, as on pages iv and v, and A' is the quantity A, with the term τ omitted. Then

$$\left.\begin{aligned} \triangle\alpha &= (m + n \sin\alpha \tan\delta) A' + B \cos\alpha \tan\delta + E, \\ \triangle\delta &= A'n \cos\alpha - B \sin\alpha. \end{aligned}\right\} \qquad (17)$$

These formulæ give the effect of nutation when terms multiplied by the squares and products of A', B and E are neglected.

The following formulæ contain those which involve the squares and products of A' and B, still neglecting the square of E and its products with A' and B as of no moment:

$$\left.\begin{aligned} \triangle^2\alpha &= \tfrac{1}{2} \frac{d^2.\triangle\alpha}{dA'^2} A'^2 + \frac{d^2.\triangle\alpha}{dA'dB} A'B + \tfrac{1}{2} \frac{d^2.\triangle\alpha}{dB^2} B^2, \\ \triangle^2\delta &= \tfrac{1}{2} \frac{d^2\triangle\delta}{dA'^2} A'^2 + \frac{d^2.\triangle\delta}{dA'dB} A'B + \tfrac{1}{2} \frac{d^2.\triangle\delta}{dB^2} B^2. \end{aligned}\right\} \qquad (18)$$

We have from (17)

$$\left.\begin{aligned} \frac{d.\triangle\alpha}{dA'} &= m + n \sin\alpha \tan\delta, & \frac{d.\triangle\delta}{dA'} &= n \cos\alpha, \\ \frac{d.\triangle\alpha}{dB} &= \cos\alpha \tan\delta, & \frac{d.\triangle\delta}{dB} &= -\sin\alpha. \end{aligned}\right\} \qquad (19)$$

Differentiating these again with respect to A' and B, and eliminating $\frac{d\alpha}{dA'}$, $\frac{d\alpha}{dB}$, &c., which are the same as $\frac{d.\triangle\alpha}{dA'}$, $\frac{d.\triangle\alpha}{dB}$, &c., we obtain

$$\left.\begin{aligned} \frac{d^2.\triangle\alpha}{dA'^2} &= \frac{n^2}{2} \sin 2\alpha + mn \cos\alpha \tan\delta + n^2 \sin 2\alpha \tan^2\delta, \\ \frac{d^2.\triangle\alpha}{dA'dB} &= n \cos^2\alpha + n \cos 2\alpha \tan^2\delta - m \sin\alpha \tan\delta \\ \frac{d^2.\triangle\alpha}{dB^2} &= -\tfrac{1}{2} \sin 2\alpha - \sin 2\alpha \tan^2\delta, \\ \frac{d^2.\triangle\delta}{dA'^2} &= -mn \sin\alpha - n^2 \sin^2\alpha \tan\delta, \\ \frac{d^2.\triangle\delta}{dA'dB} &= -\frac{n}{2} \sin 2\alpha \tan\delta - m \cos\alpha, \\ \frac{d^2.\triangle\delta}{dB^2} &= -\cos^2\alpha \tan\delta. \end{aligned}\right\} \qquad (20)$$

It will be sufficient to retain in $\triangle^2\alpha$ only the terms multiplied by $\tan^2\delta$, and in $\triangle^2\delta$ those multiplied by $\tan\delta$, and to put $A' = -0.34236 \sin\Omega = -\frac{v}{n} \sin\Omega$, and $B = -9''.2235 \cos\Omega = -u \cos\Omega$. Thus we get

$$\left.\begin{aligned}\triangle^2\alpha &= \left[\frac{uv}{2}\cos 2\alpha \sin 2\,\text{☊} - \frac{u^2+v^2}{4}\sin 2\alpha\cos 2\,\text{☊}\right]\tan^2\delta,\\ \triangle^2\delta &= -\left[\frac{uv}{4}\sin 2\alpha\sin 2\,\text{☊} + \left(\frac{u^2-v^2}{8}+\frac{u^2+v^2}{8}\cos 2\alpha\right)\cos 2\,\text{☊}\right]\tan\delta.\end{aligned}\right\}(21)$$

Hence if we put, as on page v,

$$\left.\begin{aligned} a &= \tfrac{1}{15}(m + n\sin\alpha\tan\delta,) & a' &= n\cos\alpha,\\ b &= \tfrac{1}{15}\cos\alpha\tan\delta, & b' &= -\sin\alpha,\end{aligned}\right\}(22)$$

the formulæ for the whole effect of nutation will be

$$\left.\begin{aligned}\triangle\alpha &= aA' + bB + E\\ &\quad + [0^s.0000103\cos 2\alpha\sin 2\,\text{☊} - 0^s.0000107\sin 2\alpha\cos 2\,\text{☊}]\tan^2\delta,\\ \triangle\delta &= a'A' + b'B\\ &\quad - [0''.000077\sin 2\alpha\sin 2\,\text{☊} + (0''.000023 + 0''.000080\cos 2\alpha)\cos 2\,\text{☊}]\tan\delta.\end{aligned}\right\}(23)$$

5. The effect of aberration is next to be considered. If α' and δ' denote the right ascension and declination of the star as affected by aberration, while α and δ denote the same unaffected by aberration, and $\frac{dX}{dt}$, $\frac{dY}{dt}$ and $\frac{dZ}{dt}$ denote the velocity of the earth projected on the three axes of equatorial co-ordinates, and k denote the velocity of light, we have, R' being a fictitious distance to be eliminated,

$$\left.\begin{aligned} R'\cos\delta'\cos\alpha' &= \cos\delta\cos\alpha + \frac{1}{k}\frac{dX}{dt},\\ R'\cos\delta'\sin\alpha' &= \cos\delta\sin\alpha + \frac{1}{k}\frac{dY}{dt},\\ R'\sin\delta' &= \sin\delta + \frac{1}{k}\frac{dZ}{dt}.\end{aligned}\right\}(24)$$

Whence are derived

$$\left.\begin{aligned} R'\cos\delta'\sin(\alpha'-\alpha) &= -\frac{1}{k}\left[\frac{dX}{dt}\sin\alpha - \frac{dY}{dt}\cos\alpha\right],\\ R'\cos\delta'\cos(\alpha'-\alpha) &= \cos\delta + \frac{1}{k}\left[\frac{dX}{dt}\cos\alpha + \frac{dY}{dt}\sin\alpha\right],\\ R'\sin(\delta'-\delta) &= -\frac{1}{k}\left[\frac{dX}{dt}\sin\delta\cos\alpha + \frac{dY}{dt}\sin\delta\sin\alpha - \frac{dZ}{dt}\cos\delta\right]\\ &\quad - \frac{1}{2k^2}\tan\delta\left[\frac{dX}{dt}\sin\alpha - \frac{dY}{dt}\cos\alpha\right]^2,\\ R'\cos(\delta'-\delta) &= 1 + \frac{1}{k}\left[\frac{dX}{dt}\cos\delta\cos\alpha + \frac{dY}{dt}\cos\delta\sin\alpha + \frac{dZ}{dt}\sin\delta\right]\\ &\quad + \frac{1}{2k^2}\left[\frac{dX}{dt}\sin\alpha - \frac{dY}{dt}\cos\alpha\right]^2;\end{aligned}\right\}(25)$$

from which, to quantities of the second order, we have

$$\left.\begin{aligned}\alpha'-\alpha &= -\frac{1}{k}\sec\delta\left[\frac{dX}{dt}\sin\alpha - \frac{dY}{dt}\cos\alpha\right]\\ &\quad + \frac{1}{k^2}\sec^2\delta\left(\frac{dX}{dt}\sin\alpha - \frac{dY}{dt}\cos\alpha\right)\left(\frac{dX}{dt}\cos\alpha + \frac{dY}{dt}\sin\alpha\right),\\ \delta'-\delta &= -\frac{1}{k}\left[\frac{dX}{dt}\sin\delta\cos\alpha + \frac{dY}{dt}\sin\delta\sin\alpha - \frac{dZ}{dt}\cos\delta\right]\\ &\quad - \frac{1}{2k^2}\tan\delta\left[\frac{dX}{dt}\sin\alpha - \frac{dY}{dt}\cos\alpha\right]^2\\ &\quad + \frac{1}{k^2}\left(\frac{dX}{dt}\sin\delta\cos\alpha + \frac{dY}{dt}\sin\delta\sin\alpha - \frac{dZ}{dt}\cos\delta\right)\times\\ &\qquad \left(\frac{dX}{dt}\cos\delta\cos\alpha + \frac{dY}{dt}\cos\delta\sin\alpha + \frac{dZ}{dt}\sin\delta\right).\end{aligned}\right\}(26)$$

If r is the radius vector of the earth, and ω the obliquity of the ecliptic,

$$\left.\begin{aligned} X &= -r\cos\odot, \\ Y &= -r\sin\odot\cos\omega, \\ Z &= -r\sin\odot\sin\omega. \end{aligned}\right\} \quad (27)$$

And, if e denote the eccentricity of the earth's orbit, Γ the longitude of the solar perigee, and n the mean sidereal motion of the sun,

$$\left.\begin{aligned} \frac{dr}{dt} &= \frac{an}{\sqrt{(1-e^2)}}\, e\sin(\odot-\Gamma), \\ r\frac{d\odot}{dt} &= \frac{an}{\sqrt{(1-e^2)}}\,[1+e\cos(\odot-\Gamma)]. \end{aligned}\right\} \quad (28)$$

Whence we derive

$$\left.\begin{aligned} \frac{dX}{dt} &= \frac{an}{\sqrt{(1-e^2)}}\,[\sin\odot+e\sin\Gamma], \\ \frac{dY}{dt} &= -\frac{an}{\sqrt{(1-e^2)}}\cos\omega\,[\cos\odot+e\cos\Gamma], \\ \frac{dZ}{dt} &= -\frac{an}{\sqrt{(1-e^2)}}\sin\omega\,[\cos\odot+e\cos\Gamma], \end{aligned}\right\} \quad (29)$$

By substituting these values in the expressions (26) for $\alpha'-\alpha$ and $\delta'-\delta$, making $\frac{an}{k\sqrt{(1-e^2)}} = \varkappa$, and omitting the terms which are independent of $\odot$, we have

$$\begin{aligned} \alpha'-\alpha = &-\varkappa\sec\delta\quad[\sin\alpha\sin\odot+\cos\alpha\cos\omega\cos\odot] \\ &-\frac{\varkappa^2}{4}\sec^2\delta\,[(1+\cos^2\omega)\sin 2\alpha\cos 2\odot-2\cos\omega\cos 2\alpha\sin 2\odot], \\ \delta'-\delta = &-\varkappa\quad[\sin\delta\cos\alpha\sin\odot-(\cos\omega\sin\delta\sin\alpha-\sin\omega\cos\delta)\cos\odot] \\ &-\frac{\varkappa^2}{8}\tan\delta\,[\big((1+\cos^2\omega)\cos 2\alpha-\sin^2\omega\big)\cos 2\odot+2\cos\omega\sin 2\alpha\sin 2\odot]. \end{aligned}$$

In these formulæ terms multiplied by $\varkappa^2 e$ have been neglected, as also the terms in $\delta'-\delta$ multiplied by $\varkappa^2$ which are not also multiplied by $\tan\delta$. Substituting for $\varkappa$ STRUVE'S value $20''.4451$, these formulæ become

$$\left.\begin{aligned} \alpha'-\alpha = &-20''.4451\sec\delta\,[\sin\alpha\sin\odot+\cos\alpha\cos\omega\cos\odot] \\ &-0''.0009329\sec^2\delta\sin 2\alpha\cos 2\odot \\ &+0''.0009295\sec^2\delta\cos 2\alpha\sin 2\odot, \\ \delta'-\delta = &-20''.4451\sin\delta\cos\alpha\sin\odot \\ &+20''.4451\cos\odot\,[\sin\delta\sin\alpha\cos\omega-\cos\delta\sin\omega] \\ &-0''.0004648\tan\delta\sin 2\alpha\sin 2\odot \\ &+[0''.0000402-0''.0004665\cos 2\alpha]\tan\delta\cos 2\odot. \end{aligned}\right\} \quad (30)$$

6. The values of α, δ, $\odot$ and ω to be employed here are those affected by nutation. Hence if we use values referred to the mean equinox of date, we must add to $\alpha'-\alpha$ the terms

$$\left.\begin{aligned} &\frac{d(\alpha'-\alpha)}{d\alpha}\triangle\alpha+\frac{d(\alpha'-\alpha)}{d\delta}\triangle\delta+\frac{d(\alpha'-\alpha)}{d\odot}\triangle\odot+\frac{d(\alpha'-\alpha)}{d\omega}\triangle\omega; \\ &\text{and to } \delta'-\delta \\ &\frac{d(\delta'-\delta)}{d\alpha}\triangle\alpha+\frac{d(\delta'-\delta)}{d\delta}\triangle\delta+\frac{d(\delta'-\delta)}{d\odot}\triangle\odot+\frac{d(\delta'-\delta)}{d\omega}\triangle\omega. \end{aligned}\right\} \quad (31)$$

The terms multiplied by $\triangle\odot$ and $\triangle\omega$ are of no importance, and it will be sufficient to put

$$\left.\begin{aligned} \triangle\alpha &= -[b\sin\alpha\sin\mathfrak{Q}+a\cos\alpha\cos\mathfrak{Q}]\tan\delta, \\ \triangle\delta &= -b\cos\alpha\sin\mathfrak{Q}+a\sin\alpha\cos\mathfrak{Q}, \end{aligned}\right\} \quad (32)$$

where $b = 6''.865$ and $a = 9''.2235$.

Then the terms, to add to $\alpha' - \alpha$, will be

$$\frac{20''.4451}{2} \tan\delta \sec\delta \left\{ \begin{array}{l} -(b + a\cos\omega)\sin 2\alpha \cos(\odot + \mathfrak{Q}) \\ +(b\cos\omega + a)\cos 2\alpha \sin(\odot + \mathfrak{Q}) \\ +(b - a\cos\omega)\sin 2\alpha \cos(\odot - \mathfrak{Q}) \\ -(b\cos\omega - a)\cos 2\alpha \sin(\odot - \mathfrak{Q}) \end{array} \right\};$$

and to $\delta' - \delta$ (33)

$$\frac{20''.4451}{4} \sin\delta \tan\delta \left\{ \begin{array}{l} -(b + a\cos\omega)\cos 2\alpha \cos(\odot + \mathfrak{Q}) \\ -(b\cos\omega + a)\sin 2\alpha \sin(\odot + \mathfrak{Q}) \\ +(b - a\cos\omega)\cos 2\alpha \cos(\odot - \mathfrak{Q}) \\ +(b\cos\omega - a)\sin 2\alpha \sin(\odot - \mathfrak{Q}) \\ +(b - a\cos\omega)\cos(\odot + \mathfrak{Q}) \\ -(b + a\cos\omega)\cos(\odot - \mathfrak{Q}) \end{array} \right\};$$

Or, the numerical values of a, b and ω being substituted, we have, as on page vi, for the terms to add to $\alpha' - \alpha$, expressed in time,

$$\left\{ \begin{array}{l} -0^s.00005065 \sin 2\alpha \cos(\odot + \mathfrak{Q}) \\ +0^s.00005129 \cos 2\alpha \sin(\odot + \mathfrak{Q}) \\ -0^s.00000527 \sin 2\alpha \cos(\odot - \mathfrak{Q}) \\ +0^s.00000966 \cos 2\alpha \sin(\odot - \mathfrak{Q}) \end{array} \right\} \tan\delta \sec\delta,$$

and to $\delta' - \delta$ (34)

$$\left\{ \begin{array}{l} -0''.0003799 \cos 2\alpha \cos(\odot + \mathfrak{Q}) \\ -0''.0003847 \sin 2\alpha \sin(\odot + \mathfrak{Q}) \\ -0''.0000395 \cos 2\alpha \cos(\odot - \mathfrak{Q}) \\ -0''.0000725 \sin 2\alpha \sin(\odot - \mathfrak{Q}) \\ -0''.0000391 \cos(\odot + \mathfrak{Q}) \\ -0''.0003799 \cos(\odot - \mathfrak{Q}) \end{array} \right\} \sin\delta \tan\delta,$$

7. If now we make, as on page v,

$$\left. \begin{array}{ll} C = & -20''.4451 \cos\omega \cos\odot, \\ D = & -20''.4451 \sin\odot, \\ c = & \frac{1}{15} \cos\alpha \sec\delta, \\ d = & \frac{1}{15} \sin\alpha \sec\delta, \\ c' = & \tan\omega \cos\delta - \sin\alpha \sin\delta, \\ d' = & \cos\alpha \sin\delta, \end{array} \right\} \quad (35)$$

we shall have the combined effect of nutation and aberration on the place of the star, terms of the second order being omitted, by the formulæ

$$\left. \begin{array}{l} \alpha' - \alpha = aA' + bB + cC + dD + E, \\ \delta' - \delta = a'A' + b'B + c'C + d'D. \end{array} \right\} \quad (37)$$

If we wish to include the mean motion of the star from the beginning of the year, we must add, respectively, to these expressions the terms $(a + \mu)\tau$ and $(a' + \mu')\tau$, where for a, a', μ and μ' should be taken their values, not for date, but for the time $\frac{\tau}{2}$. Hence if we make $A' + \tau = A$, the formulæ become in this case,

$$\left. \begin{array}{l} \alpha' - \alpha = aA + bB + cC + dD + E + \mu\tau, \\ \delta' - \delta = a'A + b'B + c'C + d'D + \mu'\tau; \end{array} \right\} \quad (38)$$

and to our terms of the second order must be added in right ascension $-\frac{1}{2}\frac{da}{d\tau}\tau^2$ and in declination $-\frac{1}{2}\frac{da'}{d\tau}\tau^2$; or better, if μ and μ' in the last two equations denote their values at the beginning of the year, these terms will be $-\frac{1}{2}\frac{d^2a}{d\tau^2}\tau^2$ and $-\frac{1}{2}\frac{d^2\delta}{d\tau^2}\tau^2$ where $\frac{d^2a}{d\tau^2}$ and $\frac{d^2\delta}{d\tau^2}$ have the values given on page xix. Neglecting the variation of m and n, and the terms not multiplied by $\tan\delta$ or $\tan^2\delta$, these terms of the second order are, as on page vi,

$$\left. \begin{array}{l} \triangle(\alpha' - \alpha) = +0^s.000003\,\tau^2 \sin\alpha \tan\delta \\ \qquad\qquad -0^s.000149\,\tau^2 \cos\alpha \tan\delta \\ \qquad\qquad -0^s.0000650\,\tau^2 \sin 2\alpha \tan^2\delta, \\ \triangle(\delta' - \delta') = +0''.000975\,\tau^2 \sin^2\alpha \tan\delta. \end{array} \right\} \quad (39)$$

8. In order that the subject of star reductions may be complete, it is necessary to consider the effect of orbital motion in double stars. The corrections of the right ascension and declination have always this form

$$\left.\begin{aligned} \triangle\alpha &= a + bt + k \sin(u + K), \\ \triangle\delta &= a' + b't + k' \sin(u + K'), \end{aligned}\right\} \quad (40)$$

where u is derived from the equation

$$u - e \sin u = n(t - T). \quad (41)$$

Construction of Table XXIV.

9. It will be convenient to divide the quantities A and B each into two parts, so that $A = A_\odot + A_\Omega$, and $B = B_\odot + B_\Omega$, where for the epoch 1870 the values of $A_\odot$, A_Ω, $B_\odot$, B_Ω are

$$\left.\begin{aligned} A_\odot &= \tau + [6.5942] \sin \odot + [7.4644] \cos \odot - [8.4012] \sin 2\odot, \\ B_\odot &= -[7.9609] \sin \odot - [7.2370] \cos \odot - [9.7410] \cos 2\odot, \\ C &= -[1.27313] \cos \odot, \\ D &= -[1.31059] \sin \odot, \\ A_\Omega &= -[9.53457 + 0.4t] \sin \Omega + [7.6128] \sin 2\Omega, \\ B_\Omega &= -[0.96490] \cos \Omega + [8.9518] \cos 2\Omega, \\ E_\Omega &= -[7.4951 - 6.6t] \sin \Omega. \end{aligned}\right\} \quad (42)$$

And we write, the term $E_\odot$ being neglected,

$$\left.\begin{aligned} \triangle_\odot\alpha &= aA_\odot + bB_\odot + cC + dD + \mu\tau, \\ \triangle_\odot\delta &= a'A_\odot + b'B_\odot + c'C + d'D + \mu'\tau, \\ \triangle_\Omega\alpha &= aA_\Omega + bB_\Omega + E_\Omega, \\ \triangle_\Omega\delta &= a'A_\Omega + b'B_\Omega. \end{aligned}\right\} \quad (43)$$

To $\triangle_\odot\alpha$ and $\triangle_\odot\delta$ are added the terms of the second order in aberration, given on pages xxii and xxiii, and to $\triangle_\Omega\alpha$ and $\triangle_\Omega\delta$ the terms of the second order in nutation given on page xxi, whenever they are sensible.

If now we make

$$\left.\begin{aligned} p_\odot &= -[1.31059]\, d + [6.5942]\, a - [7.9609]\, b, \\ q_\odot &= -[1.27313]\, c + [7.4644]\, a - [7.2370]\, b, \\ p_{2\odot} &= -[8.4012]\, a + [5.7922] \sec^2\delta \cos 2\alpha, \\ q_{2\odot} &= -[9.7410]\, b - [5.7938] \sec^2\delta \sin 2\alpha, \\ p'_\odot &= -[1.31059]\, d' + [6.5942]\, a' - [7.9609]\, b', \\ q'_\odot &= -[1.27313]\, c' + [7.4644]\, a' - [7.2370]\, b', \\ p'_{2\odot} &= -[8.4012]\, a' - [6.6673] \tan\delta \sin 2\alpha, \\ q'_{2\odot} &= -[9.7410]\, b' - [6.6688] \tan\delta \cos 2\alpha + [5.6042] \tan\delta, \end{aligned}\right\} \quad (44)$$

we shall have, terms of the second order included,

$$\left.\begin{aligned} \triangle_\odot\alpha &= p_\odot \sin\odot + q_\odot \cos\odot + p_{2\odot} \sin 2\odot + q_{2\odot} \cos 2\odot + \frac{d\alpha}{d\tau}\tau + \tfrac{1}{2}\frac{d^2\alpha}{d\tau^2}\tau^2, \\ \triangle_\odot\delta &= p'_\odot \sin\odot + q'_\odot \cos\odot + p'_{2\odot} \sin 2\odot + q'_{2\odot} \cos 2\odot + \frac{d\delta}{d\tau}\tau + \tfrac{1}{2}\frac{d^2\delta}{d\tau^2}\tau^2. \end{aligned}\right\} \quad (45)$$

Let us make

$$\left.\begin{aligned} p_{\odot} &= k_{\odot} \cos K_{\odot}, & p'_{\odot} &= k'_{\odot} \cos K'_{\odot},\\ q_{\odot} &= k_{\odot} \sin K_{\odot}, & q'_{\odot} &= k'_{\odot} \sin K'_{\odot},\\ p_{2\odot} &= k_{2\odot} \cos K_{2\odot}, & p'_{2\odot} &= k'_{2\odot} \cos K'_{2\odot},\\ q_{2\odot} &= k_{2\odot} \sin K_{2\odot}, & q'_{2\odot} &= k'_{2\odot} \sin K'_{2\odot}. \end{aligned}\right\} (46)$$

The above equations take the form

$$\left.\begin{aligned} \Delta_{\odot}\alpha &= \frac{\mathrm{d}\alpha}{\mathrm{d}\tau}\tau + \tfrac{1}{2}\frac{\mathrm{d}^2\alpha}{\mathrm{d}\tau^2}\tau^2 + k_{\odot}\sin(\odot + K_{\odot}) + k_{2\odot}\sin(2\odot + K_{2\odot}),\\ \Delta_{\odot}\delta &= \frac{\mathrm{d}\delta}{\mathrm{d}\tau}\tau + \tfrac{1}{2}\frac{\mathrm{d}^2\delta}{\mathrm{d}\tau^2}\tau^2 + k'_{\odot}\sin(\odot + K'_{\odot}) + k'_{2\odot}\sin(2\odot + K'_{2\odot}), \end{aligned}\right\} (47)$$

10. To compute the variations of $\Delta_{\odot}\alpha$ and $\Delta_{\odot}\delta$ in 10 years, which are given in Table XXIV, we compute values of $p_{\odot}$, $q_{\odot}$, &c., for 1880, and subtract from them the values for 1870; calling the remainders $\delta p_{\odot}, \delta q_{\odot}$, &c.; then, certain very small terms being neglected, we have evidently these equations:

$$\left.\begin{aligned} \delta.\Delta_{\odot}\alpha = {} & \delta p_{\odot}.\sin\odot + \delta q_{\odot}.\cos\odot + \delta p_{2\odot}.\sin 2\odot + \delta q_{2\odot}.\cos 2\odot\\ & + 10\frac{\mathrm{d}^2\alpha}{\mathrm{d}\tau^2}\tau + k_{\odot}\cos(\odot + K_{\odot}).\,\delta\odot,\\ \delta.\Delta_{\odot}\delta = {} & \delta p'_{\odot}.\sin\odot + \delta q'_{\odot}.\cos\odot + \delta p'_{2\odot}.\sin 2\odot + \delta q'_{2\odot}.\cos 2\odot\\ & + 10\frac{\mathrm{d}^2\delta}{\mathrm{d}\tau^2}\tau + k'_{\odot}\cos(\odot + K'_{\odot})\,\delta\odot. \end{aligned}\right\} (48)$$

The value of $\delta\odot$ is $[6.0057]\sin(\odot - 15^{\circ})$; substituting this, we have

$$\left.\begin{aligned} \delta.\Delta_{\odot}\alpha = {} & 10\frac{\mathrm{d}^2\alpha}{\mathrm{d}\tau^2}\tau - [5.7047]\,k_{\odot}\sin(K_{\odot} + 15^{\circ}) + \delta p_{\odot}.\sin\odot + \delta q_{\odot}.\cos\odot\\ & + [\delta p_{2\odot} + [5.7047]\,k_{\odot}\cos(K_{\odot} - 15^{\circ})]\sin 2\odot\\ & + [\delta q_{2\odot} + [5.7047]\,k_{\odot}\sin(K_{\odot} - 15^{\circ})]\cos 2\odot,\\ \delta.\Delta_{\odot}\delta = {} & 10\frac{\mathrm{d}^2\delta}{\mathrm{d}\tau^2}\tau - [5.7047]\,k'_{\odot}\sin(K'_{\odot} + 15^{\circ}) + \delta p'_{\odot}.\sin\odot + \delta q'_{\odot}.\cos\odot\\ & + [\delta p'_{2\odot} + [5.7047]\,k'_{\odot}\cos(K'_{\odot} - 15^{\circ})]\sin 2\odot\\ & + [\delta q'_{2\odot} + [5.7047]\,k'_{\odot}\sin(K'_{\odot} - 15^{\circ})]\cos 2\odot. \end{aligned}\right\} (49)$$

As in the case of $\Delta_{\odot}\alpha$ and $\Delta_{\odot}\delta$ these quantities can be made to take the form

$$\left.\begin{aligned} \delta.\Delta_{\odot}\alpha &= a + b\tau + h_{\odot}\sin(\odot + H_{\odot}) + h_{2\odot}\sin(2\odot + H_{2\odot}),\\ \delta.\Delta_{\odot}\delta &= a' + b'\tau + h'_{\odot}\sin(\odot + H'_{\odot}) + h'_{2\odot}\sin(2\odot + H'_{2\odot}). \end{aligned}\right\} (50)$$

Except for stars near the pole, the first and last terms of these equations may be neglected, and regard be had in computing $\delta p_{\odot}$, $\delta q_{\odot}$, &c., only to the variations of c, d, c' and d' in the formulæ for $p_{\odot}$, $q_{\odot}$, &c. Then

$$\left.\begin{aligned} \delta.\Delta_{\odot}\alpha &= 10\frac{\mathrm{d}^2\alpha}{\mathrm{d}\tau^2}\tau + h_{\odot}\sin(\odot + H_{\odot}),\\ \delta.\Delta_{\odot}\delta &= 10\frac{\mathrm{d}^2\delta}{\mathrm{d}\tau^2}\tau + h'_{\odot}\sin(\odot + H'_{\odot}). \end{aligned}\right\} (51)$$

11. In computing $\Delta_{\odot}\alpha$ and $\Delta_{\odot}\delta$, we may either suppose $k_{\odot}, K_{\odot}, k'_{\odot}$ and $K'_{\odot}$ constant throughout the year, and afterwards add to $\Delta_{\odot}\alpha$ and $\Delta_{\odot}\delta$ thus obtained, the proper fractional part of $h_{\odot}\sin(\odot + H_{\odot})$ and $h'_{\odot}\sin(\odot + H'_{\odot})$ for the fraction of the year; or we may make them to vary from date to date. For stars, whose declination is within the limits $\pm 65^{\circ}$, there is, however, no need to attend to this correction.

Having formed a table of $\odot$ for every 10 sidereal days, beginning with the fictitious year, we can readily get $\odot$ for the time of the star's transit over the fictitious meridian

with the constant interpolation factor $\frac{\alpha - 18^h\,40^m}{240^h}$, and thus form the arguments $\odot + K_\odot$, $2\odot + K_{2\odot}$, $\odot + H_\odot$, &c.

Terms with small coefficients can be most readily formed by means of a Traverse Table.

12. We can reduce $\triangle_\Omega\alpha$ and $\triangle_\Omega\delta$ to the forms, terms of the second order included,

$$\left.\begin{aligned}\triangle_\Omega\alpha &= k_\Omega \sin(\Omega + K_\Omega) + k_{2\Omega} \sin(2\Omega + K_{2\Omega}),\\ \triangle_\Omega\delta &= k'_\Omega \sin(\Omega + K'_\Omega) + k'_{2\Omega} \sin(2\Omega + K'_{2\Omega}),\end{aligned}\right\}$$

by making

$$\left.\begin{aligned} k_\Omega \cos K_\Omega &= -[9.53457 + 0.4t]\,a - 0^s.0031,\\ k'_\Omega \sin K_\Omega &= -[0.96490]\,b,\\ k_{2\Omega} \cos K_{2\Omega} &= [7.6128]\,a + [5.0114] \cos 2\alpha \tan^2\delta,\\ k_{2\Omega} \sin K_{2\Omega} &= [8.9518]\,b - [5.0294] \sin 2\alpha \tan^2\delta,\\ k'_\Omega \cos K'_\Omega &= -[9.53457 + 0.4t]\,a',\\ k'_\Omega \sin K'_\Omega &= -[0.96490]\,b',\\ k'_{2\Omega} \cos K'_{2\Omega} &= [7.6128]\,a' - [5.8865] \sin 2\alpha \tan\delta,\\ k'_{2\Omega} \sin K'_{2\Omega} &= [8.9518]\,b' - [5.9031] \cos 2\alpha \tan\delta - [5.3617] \tan\delta.\end{aligned}\right\} (52)$$

But perhaps it will be as well to adopt the formulæ

$$\left.\begin{aligned}\triangle_\Omega\alpha &= aA_\Omega + bB_\Omega + E_\Omega,\\ \triangle_\Omega\delta &= a'A_\Omega + b'B_\Omega,\end{aligned}\right\} (53)$$

or,

$$\left.\begin{aligned}\triangle_\Omega\alpha &= f_\Omega + g_\Omega \sin(G_\Omega + \alpha) \tan\delta,\\ \triangle_\Omega\delta &= g_\Omega \cos(G_\Omega + \alpha).\end{aligned}\right\} (54)$$

Tables *A* to *E*, pages xxx–xxxv, give all the data needed for the computation of equations (45) to (54), for the period embraced in Table XXIV.

13. Table XXVII. For stars near the pole it will be well to construct tables giving, with the arguments $\odot + \Omega$ and $\odot - \Omega$, the values of small terms given on page xxiii. These will be most readily computed with the aid of a Traverse Table, when they have been reduced to the forms

$$\left.\begin{aligned}\triangle_{\odot+\Omega}\alpha &= k_{\odot+\Omega} \sin(\odot + \Omega + K_{\odot+\Omega}),\\ \triangle_{\odot+\Omega}\delta &= k'_{\odot+\Omega} \sin(\odot + \Omega + K'_{\odot+\Omega}),\\ \triangle_{\odot-\Omega}\alpha &= k_{\odot-\Omega} \sin(\odot - \Omega + K_{\odot-\Omega}),\\ \triangle_{\odot-\Omega}\delta &= k'_{\odot-\Omega} \sin(\odot - \Omega + K'_{\odot-\Omega}),\end{aligned}\right\} (55)$$

14. Table XXVIII. Tables for $\triangle_\mathbb{C}\alpha$ and $\triangle_\mathbb{C}\delta$ may be computed in the same way. For by making

$$\left.\begin{aligned} k_\mathbb{C} \cos K_\mathbb{C} &= -[7.6075]\,a,\\ k_\mathbb{C} \sin K_\mathbb{C} &= -[8.9474]\,b,\\ k'_\mathbb{C} \cos K'_\mathbb{C} &= -[7.6075]\,a',\\ k'_\mathbb{C} \sin K'_\mathbb{C} &= -[8.9474]\,b',\end{aligned}\right\} (56)$$

these quantities take the form

$$\left.\begin{aligned}\triangle_\mathbb{C}\alpha &= k_\mathbb{C} \sin(2\,\mathbb{C} + K_\mathbb{C}),\\ \triangle_\mathbb{C}\delta &= k'_\mathbb{C} \sin(2\,\mathbb{C} + K'_\mathbb{C}).\end{aligned}\right\} (57)$$

In tabulating these quantities it will be better to make sidereal time the argument rather than $\mathbb{C}$; and if they are to be tabulated for several stars, they should be interpolated forwards a time equal to $\alpha - 18^h\,40^m$, so that the argument may be the same for the transits of all the stars on the same sidereal day.

If these quantities are tabulated for every tenth of a sidereal day throughout the period of the argument, we may take advantage of the fact that this period is almost exactly 13.7 sidereal days, to arrange the Table so that there will be an interval of a sidereal day between successive values of the argument.

Example.

We will illustrate the preceding formulæ by computing $\triangle_{\odot}\alpha$ and its *Variation in* 10 *years* for β Hydri.

	For 1870.	For 1880.
$\alpha =$	$0^h\ 18^m\ 52^s.61$	$0^h\ 19^m\ 25^s.13$
$\delta =$	$-77^\circ\ 59'\ 14''$	$-77^\circ\ 55'\ 52''$
$\log a =$	0.40744	0.40538
$\log b =$	9.49449n	9.49232n
$\log c =$	9.50411	9.50202
$\log d =$	8.42083	8.43110

In this case it is not necessary to compute the terms of $p_{2\odot}$, $q_{2\odot}$, &c., which are of the order of the square of aberration, since they are altogether insensible. Deriving the values of $\frac{da}{d\tau}$ and $\frac{d^2a'}{d\tau^2}$ from Table XXI, we have in formula (45)

$$\triangle_{\odot}\alpha = 3^s.2594\,\tau - 0^s.0008\,\tau^2 - 0^s.5349 \underset{478}{\sin}\odot - 5^s.9794 \underset{507}{\cos}\odot$$
$$- 0^s.0644 \underset{41}{\sin} 2\odot + 0^s.1720 \underset{11}{\cos} 2\odot$$

The figures written below the coefficients are those which belong to the values for 1880. To facilitate computation we give to $\triangle_{\odot}\alpha$ the following form, in which the unit of τ is 10 sidereal days instead of a year, and it is counted from the first transit of the star over the fictitious meridian. This is done by substituting .027304 τ for τ, and adding the change of $\triangle_{\odot}\alpha$ in the time $\alpha - 18^h\ 40^m$ or $- 0^d.765$.

$$\triangle_{\odot}\alpha = -0^s.00681 + 0^s.088994\,\tau - 0^s.0000006\tau^2$$
$$+ \underset{641}{[0.77839]} \sin(\odot + \underset{44'.4}{264^\circ\ 53'.3}) + \underset{18}{[9.2639]} \sin(2\odot + \underset{31}{110^\circ\ 31'.})$$

Also by formula (49) we have the *Variation* of $\triangle_{\odot}\alpha$ *in* 10 *years*,

$$\delta.\triangle_{\odot}\alpha = +0^s.00033 - 0^s.000439\,\tau + 0^s.0315 \sin(\odot + 114.^\circ2) + 0^s.0012 \sin(2\odot + 279^\circ).$$

From Table *A* we obtain $\odot$ with the interpolating factor $\alpha - 18^h\ 40^m = -0^d.765$, and thus form the arguments $\odot + K_{\odot}$, &c., interpolating $K_{\odot}$ &c., to date by means of the values obtained for 1870 and 1880.

Sid. Day.	Motion of $\odot$ for $-0^d.765$.	$\odot$.	$2\odot$.	$\odot + K_{\odot}$.	$2\odot + K_{2\odot}$.	$\odot + H_{\odot}$.

$$\Delta_{\Omega}\alpha = f_{\Omega} + g_{\Omega}\sin(G_{\Omega} + \alpha)\frac{\tan\delta}{15}.$$

$$\Delta_{\Omega}\delta = g_{\Omega}\cos(G_{\Omega} + \alpha).$$

ON THE PLACES AND PROPER MOTION OF β^1 SCORPII, β AND η DRACONIS AND 61^1 CYGNI.

From a report prepared by Mr. G. W. HILL.

In this discussion almost all the materials to be derived from the well known collections of reduced observations have been employed. To accord with Dr. GOULD'S *Standard Places of Fundamental Stars*, the right ascensions as given in these collections have been reduced to the equinoctial points of ARGELANDER'S *DLX Stellarum Positiones Mediæ*. Also the systematic corrections given by Dr. AUWER'S, in the *Astronomische Nachrichten*, Vol. LXV, 370, 377–382, have been applied to the declinations.

β^1 Scorpii.

Adopting for a provisional mean place of this star that of the *Greenwich Seven-Year Catalogue* for 1860, we have for any time, with a proper motion *zero* in both co-ordinates,

$$\alpha = 15^h\ 57^m\ 18^s.08 + 3^s.47735\,(t-1860) + 0^s.0000711\,(t-1860)^2,$$
$$\delta = -19^\circ\ 25'\ 8''.37 - 10''.2316\,(t-1860) + 0''.002203\,(t-1860)^2.$$

Constructing an ephemeris from these formulæ and comparing it with the observations, both as published and corrected, we obtain the differences in columns I and II of the following table. From those in column II are derived, by the method of least squares, the following normal equations, in which $\Delta\alpha$ and $\Delta\delta$ denote the corrections of the provisional mean right ascension and declination, and μ and μ' are the proper motions in right ascension and declination for 1860:

$$\begin{aligned} 37.5\,\Delta\alpha - 810\,\mu &= +1^s.0865 \\ -810\,\Delta\alpha + 40379\,\mu &= -64^s.793 \\ 34\,\Delta\delta - 746\,\mu' &= +38''.685 \\ -746\,\Delta\delta + 39090\,\mu' &= -1279''.485. \end{aligned}$$

Whence

$$\Delta\alpha = -0^s.010, \qquad \mu = -0^s.00180$$
$$\Delta\delta = +0''.72, \qquad \mu' = -0''.0189;$$

and the corrected formulæ for the mean place of the star will be

$$\alpha = 15^h\ 57^m\ 18^s.070 + 3^s.47555\,(t-1860) + 0^s.0000712\,(t-1860)^2$$
$$\delta = -19^\circ\ 25'\ 7''.65 - 10''.2505\,(t-1860) + 0''.002200\,(t-1860)^2.$$

The differences of these and the corrected observations constitute column III of the table.

η Draconis.

Deriving a provisional place from the same authority as for the previous star, with no proper motion, we obtain the formulæ:

$$\alpha = 16^h\,22^m\,6^s.23 + 0^s.79943\,(t-1860) + 0^s.0000943\,(t-1860)^2,$$
$$\delta = +61^\circ\,49'\,54''.16 - 8''.3086\,(t-1860) + 0''.000548\,(t-1860)^2.$$

Comparing these with the published and corrected observations we have columns I and II of the following table, and we find from the latter the normal equations,

$$\begin{aligned} 36\,\Delta\alpha - 647\,\mu &= -4^s.983 \\ -647\,\Delta\alpha + 21146\,\mu &= +112^s.538 \\ 39\,\Delta\delta - 766\,\mu' &= -35''.23 \\ -766\,\Delta\delta + 38618\,\mu' &= +2293''.37. \end{aligned}$$

Whence

$$\Delta\alpha = -0^s.095, \qquad \mu = +0^s.00242$$
$$\Delta\delta = +0''.43, \qquad \mu' = +0''.0679;$$

and the corrected formulæ for the mean place of the star will be

$$\alpha = 16^h\,22^m\,6^s.135 + 0^s.80185\,(t-1860) + 0^s.0000924\,(t-1860)^2,$$
$$\delta = +61^\circ\,49'\,54''.59 - 8''.2407\,(t-1860) + 0''.000551\,(t-1860).^2$$

The differences of these and the corrected observations constitute column III of the table.

β Draconis.

The provisional place of this star derived from the same source, with no proper motion, is

$$\alpha = 17^h\,27^m\,16^s.32 + 1^s.35307\,(t-1860) + 0^s.0000256\,(t-1860)^2,$$
$$\delta = +52^\circ\,24'\,22''.71 - 2''.8543\,(t-1860) + 0''.000983\,(t-1860)^2.$$

The comparisons of these with the published and corrected observations are given in columns I and II of the following table. From column II we find the normal equations,

$$
\begin{array}{rrrrl}
35.6 & \Delta\alpha & - & 744\,\mu & = -\ 1^s.635 \\
-744 & \Delta\alpha & + & 39800\,\mu & = -\ 32^s.231 \\
43 & \Delta\delta & - & 944\,\mu' & = +\ 15''.34 \\
-944 & \Delta\delta & + & 45848\,\mu' & = -\ 440''33.
\end{array}
$$

Whence

$$\Delta\alpha = -\ 0^s.103, \qquad \mu = -\ 0^s.00273$$
$$\Delta\delta = +\ 0''.27, \qquad \mu' = -\ 0''.0041;$$

and the corrected formulæ for the mean place of the star become,

$$\alpha = 17^h\ 27^m\ 16^s.217 + 1^s.35034\,(t - 1860) + 0^s.0000257\,(t - 1860)^2,$$
$$\delta = +\ 52^\circ\ 24'\ 22''.98 - 2''.8584\,(t - 1860) + 0''.000979\,(t - 1860)^2.$$

Comparisons of which, with the corrected observations, constitute column III of the table.

61¹ Cygni.

From Dr. AUWERS' elements of the position of this star in the *Astronomische Nachrichten*, Vol. LIX, p. 354, we have

$$\alpha = 21^h\ 0^m\ 37^s.396 + 2^s.67878\,(t - 1860) + 0^s.0000207\,(t - 1860)^2,$$
$$\delta = +\ 38^\circ\ 3'\ 46''.86 + 17''.4510\,(t - 1860) + 0''.001493\,(t - 1860)^2,$$

including the proper motion in R. A., $\mu = +\ 0^s.34512$, and in Dec., $\mu' = +\ 3''.2311$.

On account of the importance of BRADLEY's two transit observations in determining the proper motion of this star, they have been reduced anew. With the equatorial intervals of the wires, as given in the Preface to the Observations, and the clock corrections and the constants of the instrumental corrections given by BESSEL, in the *Fundamenta Astronomiæ*, the resulting mean right ascensions differ more than $0^s.5$. If, however, for 1753, October 8, we derive the clock correction from the observations of α Bootis, α Aquilæ, α Cygni, and α Piscis Australis, using Dr. GOULD's well determined values of their right ascensions, we have for Oct. 8, $18^h\ 5^m$, $+\ 23^s.13$, instead of BESSEL's value $+\ 23^s.58$, or a correction of BESSEL's clock correction for that night of $-\ 0^s.43$.

Making this correction we have for the apparent R. A. for the time of transit at Greenwich,

	h m s	Wires.
1753, Sept. 25	20 55 54.54	1
Oct. 8	20 55 54.38	3

Reducing these to mean place at date with the constants derived from these tables, the effect of the two terms depending on $\mathfrak{C}$ being added, and taking the annual variation in mean R. A. at the epoch 1754 to be $+ 2^s.6695$, which is sufficiently accurate, we have as the mean R. A. for 1755.0,

	h	m	s
Sept. 25	20	55	56.23
Oct. 8	20	55	56.32

and, combined by giving double weight to the latter,

h	m	s
20	55	56.29

as the mean result from BRADLEY's observations.

Comparing the provisional formulæ with the different authorities and the corrected values as for the other stars, we have columns I and II of the following table. For the declinations the normal equations resulting from column II, are

$$54\,\Delta\delta - 1092\,\Delta\mu' = - 4''.59,$$
$$-1092\,\Delta\delta + 48478\,\Delta\mu' = + 381''.45;$$

from which,

$$\Delta\delta = + 0''.14, \qquad \Delta\mu' = + 0''.0109.$$

With regard to the right ascensions, it has been found more convenient to plot the residuals and draw a parabolic curve so as most nearly to represent them. Thus the correction of AUWERS' formula is found to be

$$+ 0^s.041 + 0^s.00653\,(t - 1860) + 0^s.000054\,(t - 1860)^2.$$

Then the formulæ for the corrected place are,

$$\alpha = 21^h\ 0^m\ 37^s.437 + 2^s.68531\,(t - 1860) + 0^s.0000747\,(t - 1860)^2$$
$$\delta = + 38°\ 3'\ 47''.00 + 17''.4619\,(t - 1860) + 0''.001493\,(t - 1860)^2,$$

in which the right ascension includes the term $+ 0^s.0000536\,(t - 1860)^2$ due to variability of proper motion.

Column III of the table shows how nearly these represent the several authorities.

ANNUAL PRECESSION OF FIXED STARS.

In Right Ascension, $\Delta\alpha = m + n \sin \alpha \tan \delta$

In Declination, $\Delta\delta = n \cos \alpha$

In Longitude, $\Delta\lambda =$ Gen. Prec. $+ \pi \cos (\lambda - M) \tan \beta$

In Latitude, $\Delta\beta = -\pi \sin (\lambda - M)$

The secular Inequality of Arg. I is to be multiplied by (t — 1850).

The variation of the mean Obliquity, — 0.″4645 τ, is combined with the nutation.

800	+0.0311	−46	1700	+0.0483	−69	2600	+0.0340	−48			

When the argument is negative the signs of the quantities in this table must be reversed.

δA_{Ω}, δB_{Ω}, $\delta E_{\odot}$ and δE_{Ω} are to be multiplied by $\frac{t-1850}{100}$. The last three are in units of the fourth decimal.

* The last term is used when the Argument exceeds 3400.

TABLE XXVII.

Terms for Circumpolar Stars depending on $\odot + \Omega$ and $\odot - \Omega$.

Arguments—*

For α Ursæ Minoris and 51 Cephei.

Year.	$\odot + \Omega$	$\odot - \Omega$
1865	377	177
1866	323	230
1867	269	284
1868	215	338
1869	161	392
1870	107	446
1871	53	500
1872	0	553
1873	946	607
1874	892	661
1875	839	715
1876	785	768
1877	731	822
1878	677	876
1879	623	929
1880	570	983

For λ Ursæ Minoris and σ Octantis.

Year.	$\odot + \Omega$	$\odot - \Omega$
1865	379	179
1866	325	232
1867	271	286
1868	217	340
1869	163	394
1870	109	448
1871	55	502
1872	2	555
1873	948	609
1874	894	663
1875	841	717
1876	787	770
1877	733	824
1878	679	878
1879	625	931
1880	572	985

*Add to the argument for the beginning of the year its motion for the Sidereal Day, on p. 248.

Argument.	α Ursæ Minoris. Arg. $= \odot + \Omega$ R.A.	α Ursæ Minoris. Arg. $= \odot + \Omega$ Dec.	α Ursæ Minoris. Arg. $= \odot - \Omega$ R.A.	α Ursæ Minoris. Arg. $= \odot - \Omega$ Dec.	51 Cephei. Arg. $= \odot + \Omega$ R.A.	Argument.
